

Package ‘astsa’

December 3, 2022

Type Package

Title Applied Statistical Time Series Analysis

Version 2.0

Date 2022-12-21

Depends R (>= 3.5)

Author David Stoffer [aut, cre], Nicky Poison [ctb, mus, spy]

Maintainer David Stoffer <stoffer@pitt.edu>

BugReports <https://github.com/nickpoison/astsa/issues>

 astsa-package

Applied Statistical Time Series Analysis (more than just data)

Description

Includes data and scripts to accompany [Time Series Analysis and Its Applications: With R Examples \(4th ed, 2017\)](#) and [Time Series: A Data Analysis Approach Using R, \(1st ed, 2019\)](#).

Details

Package:	astsa
Type:	Package
Version:	2.0
Date:	2022-12-21
License:	GPL-3
LazyLoad:	yes
LazyData:	yes

Author(s)

David Stoffer <stoffer@pitt.edu>

 acf1

Plot and print ACF or PACF of a time series

Description

Produces a plot (and a printout) of the sample ACF or PACF. The zero lag value of the ACF is removed.

Usage

```
acf1(series, max.lag=NULL, plot=TRUE, main=NULL, ylim=NULL, pacf=FALSE,
      ylab=NULL, na.action = na.pass, ...)
```

Arguments

<code>series</code>	The data. Does not have to be a time series object.
<code>max.lag</code>	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$. If the series is seasonal, this will be at least 4 seasons by default.
<code>plot</code>	If TRUE (default), a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script.
<code>main</code>	Title of graphic; defaults to name of series.
<code>ylim</code>	Specify limits for the y-axis.
<code>pacf</code>	If TRUE, the sample PACF is returned instead of ACF.
<code>ylab</code>	Change y-axis label from default.
<code>na.action</code>	How to handle missing data; default is <code>na.pass</code>
<code>...</code>	Additional arguments passed to <code>tsplot</code>

Details

Will print and/or plot the sample ACF or PACF (if `pacf=TRUE`). The zero lag of the ACF (which is always 1) has been removed. If `plot=TRUE`, a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script. The error bounds are approximate white noise bounds, $-1/n \pm 2/\sqrt{n}$; no other option is given.

Value

ACF	The sample ACF or PACF
-----	------------------------

Author(s)

D.S. Stoffer

References

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
acf1(rnorm(100))

acf1(sarima.sim(ar=.9), pacf=TRUE)

# show it to your mom:
acf1(soi, col=2:7, lwd=4, gg=TRUE)
```

acf2

*Plot and print ACF and PACF of a time series***Description**

Produces a simultaneous plot (and a printout) of the sample ACF and PACF on the same scale. The zero lag value of the ACF is removed.

Usage

```
acf2(series, max.lag=NULL, plot=TRUE, main=NULL, ylim=NULL,
      na.action = na.pass, ...)
```

Arguments

series	The data. Does not have to be a time series object.
max.lag	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$. If the series is seasonal, this will be at least 4 seasons by default.
plot	If TRUE (default), a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script.
main	Title of graphic; defaults to name of series.
ylim	Specify limits for the y-axis.
na.action	How to handle missing data; default is na.pass
...	Additional arguments passed to tsplot

Details

Will print and/or plot the sample ACF and PACF on the same scale. The zero lag of the ACF (which is always 1) has been removed. If plot=TRUE, a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script. The error bounds are approximate white noise bounds, $-1/n \pm 2/\sqrt{n}$; no other option is given.

Value

ACF	The sample ACF
PACF	The sample PACF

Author(s)

D.S. Stoffer

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
acf2(rnorm(100))

acf2(rnorm(100), 25, main='') # no title

acf2(rnorm(100), plot=FALSE[, 'ACF']) # print only ACF

acf2(soi, col=2:7, lwd=4, gg=TRUE) # mother's day present
```

acfm

*ACF and CCF for Multiple Time Series***Description**

Produces a grid of plots of the sample ACF (diagonal) and CCF (off-diagonal).

Usage

```
acfm(series, max.lag = NULL, na.action = na.pass, ylim = NULL,
      acf.highlight = TRUE, ...)
```

Arguments

<code>series</code>	Multiple time series (at least 2 columns of time series)
<code>max.lag</code>	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$. If the series is seasonal, this will be at least 4 seasons by default.
<code>na.action</code>	How to handle missing data; default is <code>na.pass</code>
<code>ylim</code>	Specify limits for the all correlation axes. If <code>NULL</code> (default) the values are a little wider than the min and max of all values.
<code>acf.highlight</code>	If <code>TRUE</code> (default), the diagonals (ACFs) are highlighted.
<code>...</code>	Additional arguments passed to <code>tsplot</code>

Details

Produces a grid of plots of the sample ACF (diagonal) and CCF (off-diagonal). The plots in the grid are estimates of $\text{corr}\{x(t+\text{LAG}), y(t)\}$. Thus x leads y if LAG is positive and x lags y if LAG is negative.

Examples

```
acfm(diff(log(econ5)))

acfm(diff(log(econ5)), gg=TRUE, acf=FALSE)
```

ar.mcmc

*Fit Bayesian AR Model***Description**

Uses Gibbs sampling to fit an AR model to time series data.

Usage

```
ar.mcmc(xdata, porder, n.iter = 1000, n.warmup = 100, plot = TRUE, col = 4,
        prior_var_phi = 50, prior_sig_a = 1, prior_sig_b = 2)
```

Arguments

xdata	time series data (univariate only)
porder	autoregression order
n.iter	number of iterations for the sampler
n.warmup	number of startup iterations for the sampler (these are removed)
plot	if TRUE (default) returns two graphics, (1) the draws after warmup and (2) a scatterplot matrix of the draws with histograms on the diagonal
col	color of the plots
prior_var_phi	prior variance of the vector of AR coefficients; see details
prior_sig_a	first prior for the variance component; see details
prior_sig_b	second prior for the variance component; see details

Details

Assumes a normal-inverse gamma model,

$$x_t = \phi_0 + \phi_1 x_{t-1} + \dots + \phi_p x_{t-p} + \sigma z_t,$$

where z_t is standard Gaussian noise. With Φ being the $(p+1)$ -dimensional vector of the ϕ s, the priors are $\Phi \mid \sigma \sim N(0, \sigma^2 V_0)$ and $\sigma^2 \sim IG(a, b)$, where $V_0 = \gamma^2 I$. Defaults are given for the hyperparameters, but the user may choose (a, b) as (prior_sig_a, prior_sig_b) and γ^2 as prior_var_phi.

The algorithm is efficient and converges quickly. Further details can be found in Example 8.36 of Douc, Moulines, & Stoffer, D. (2014). *Nonlinear Time Series: Theory, Methods and Applications with R Examples*. CRC press. ISBN 9781466502253.

Value

In addition to the graphics (if plot is TRUE), the draws of each parameter (phi0, phi1, ..., sigma) are returned invisibly and various quantiles are displayed.

Author(s)

D.S. Stoffer

Source

Based on the script `arp.mcmc` used in Douc, Moulines, & Stoffer, D. (2014). *Nonlinear Time Series: Theory, Methods and Applications with R Examples*. CRC press. ISBN 9781466502253.

Examples

```
## Not run:

u = ar.mcmc(rec, 2)

tsplot(u, ncolm=2, col=4) # plot the traces

apply(u, 2, ESS) # effective sample sizes

## End(Not run)
```

ar1miss

AR with Missing Values

Description

Data used in Chapter 6

Format

The format is: Time-Series [1:100] with NA for missing values.

References

You can find demonstrations of `astsa` capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

arf

*Simulated ARFIMA***Description**

1000 simulated observations from an ARFIMA(1, 1, 0) model with $\phi = .75$ and $d = .4$.

Format

The format is: Time-Series [1:1000] from 1 to 1000: -0.0294 0.7487 -0.3386 -1.0332 -0.2627 ...

References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

arma.spec

*Spectral Density of an ARMA Model***Description**

Gives the ARMA spectrum, tests for causality, invertibility, and common zeros.

Usage

```
arma.spec(ar = 0, ma = 0, var.noise = 1, n.freq = 500,
          main='from specified model', frequency=1, ylim=NULL, ...)
```

Arguments

ar	vector of AR parameters
ma	vector of MA parameters
var.noise	variance of the noise
n.freq	number of frequencies
main	title of graphic
frequency	for seasonal models, adjusts the frequency scale
ylim	optional; specify limits for the y-axis
...	additional arguments

Details

The basic call is `arma.spec(ar, ma)` where `ar` and `ma` are vectors containing the model parameters. Use `log='y'` if you want the plot on a log scale. If the model is not causal or invertible an error message is given. If there are approximate common zeros, a spectrum will be displayed and a warning will be given; e.g., `arma.spec(ar=.9, ma=-.9)` will yield a warning and the plot will be the spectrum of white noise.

Value

<code>freq</code>	frequencies - returned invisibly
<code>spec</code>	spectral ordinates - returned invisibly

Author(s)

D.S. Stoffer

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
arma.spec(ar = c(1, -.9), ma = .8)

arma.spec(ar = c(1, -.9), log='y')

arma.spec(ar = c(1, -.9), main='AR(2)', gg=TRUE, col=5, lwd=2)

arma.spec(ar=c(rep(0,11),.4), ma=.5, col=5, lwd=3, frequency=12)
```

 ARMAtoAR

Convert ARMA Process to Infinite AR Process

Description

Gives the π -weights in the invertible representation of an ARMA model.

Usage

```
ARMAtoAR(ar = 0, ma = 0, lag.max=20)
```

Arguments

<code>ar</code>	vector of AR coefficients
<code>ma</code>	vector of MA coefficients
<code>lag.max</code>	number of pi-weights desired

Value

A vector of coefficients.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
ARMAtoAR(ar=.9, ma=.5, 10)
```

```
astsa.col
```

```
astsa color palette with transparency
```

Description

Modifies the opacity level of the astsa color palette.

Usage

```
astsa.col(col = 1, alpha = 1)
```

Arguments

col	numerical vector representing colors (default is 1 or 'black') - see Examples
alpha	factor in [0,1] setting the opacity (default is 1)

Value

a color vector using the astsa color palette at the chosen transparency level

Note

The astsa color palette is attached when the package is attached. The colors follow the R pattern of shades of: (1) black, (2) red, (3) green, (4) blue, (5) cyan, (6) magenta, (7) gold, (8) gray. The opacity of these colors can be changed easily using this script. Values are recycled, e.g., col=9 is the same as col=1.

The astsa palette was developed from two basic ideas. The first is the general idea that time series should be plotted using dark colors. The second is personal in that we prefer to anchor plots with the best blue, dodgerblue3. From there, we used the website <https://www.color-hex.com/> to pick colors of type 2 to 7 that complement dodgerblue3.

Author(s)

D.S.Stoffer

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
# plotting 2 series that touch (but in a nice way)
tsplot(cbind(gtemp_land, gtemp_ocean), col=astsa.col(c(4,2), .5), lwd=2, spaghetti=TRUE,
       type='o', pch=20, ylab="Temperature Deviations")
legend('topleft', legend=c("Land Only", "Ocean Only"), col=c(4,2), lwd=2, pch=20, bty='n')

# View the astsa palette
barplot(rep(1,8), col=1:8, main='astsa palette', names=1:8)
```

autoSpec

autoSpec - Changepoint Detection of Narrowband Frequency Changes

Description

Uses changepoint detection to discover if there have been slight changes in frequency in a time series. The autoSpec procedure uses minimum description length (MDL) to do nonparametric spectral estimation with the goal of detecting changepoints. Optimization is accomplished via a genetic algorithm (GA).

Usage

```
autoSpec(xdata, n = length(xdata), Pi.B = 10/n, Pi.C = (n - 10)/n, PopSize = 70,
        generation = 70, P0 = 20, Pi.P = 0.3, Pi.N = 0.3, NI = 7, taper = 0.5,
        max.period = 2)
```

Arguments

xdata	time series to be analyzed; the ts attributes are stripped prior to the analysis
n	the number of observations - should not be specified; it is only used for the defaults of Pi.B and Pi.C.
Pi.B	probability of being a breakpoint in initial stage; default is 10/n. Does not need to be specified.
Pi.C	probability of conducting crossover; default is (n-10)/n. Does not need to be specified.
PopSize	population size (default is 70); the number of chromosomes in each generation. Does not need to be specified.
generation	number of iterations; default is 70. Does not need to be specified.
P0	maximum width of the Bartlett kernel is $2 \times P0 + 1$; default is 20. Does not need to be specified.

Pi.P	probability of taking parent's gene in mutation; default is 0.3. Does not need to be specified.
Pi.N	probability of taking -1 in mutation; default is 0.3 Does not need to be specified.
NI	number if islands; default is 7. Does not need to be specified.
taper	half width of taper used in spectral estimate; .5 (default) is full taper
max.period	the frequency range [0, 1/max.period] over which to calculate the Whittle likelihood; the default is 2 (the min).

Details

Details may be found in Stoffer, D. S. (2023). AutoSpec: Detection of narrowband frequency changes in time series. *Statistics and Its Interface*, 16(1), 97-108. <https://dx.doi.org/10.4310/21-SII703>

Value

Returns three values, (1) the breakpoints including the endpoints, (2) the number of segments, and (3) the segment kernel orders. See the examples.

Note

The code was adapted from the code used in Davis, Lee, & Rodriguez-Yam (2006). Structural break estimation for nonstationary time series models. *Journal of the American Statistical Association*, 101(473), 223-239.

Examples

```
## Not run:

##-- simulation
num = 500
t   = 1:num
w   = 2*pi/25
d   = 2*pi/150
x1  = 2*cos(w*t)*cos(d*t) + rnorm(num)
x2  = cos(w*t) + rnorm(num)
x   = c(x1,x2)

##-- periodogram - all action below 0.1
mvspec(x)
```

```

##-- run procedure
autoSpec(x, max.period=10)

##-- output (yours will be slightly different -
##--         the nature of GA)
# returned breakpoints include the endpoints
# $breakpoints
# [1] 1 526 1000
#
# $number_of_segments
# [1] 2
#
# $segment_kernel_orders_m
# [1] 2 1

##-- plot everything
par(mfrow=c(3,1))
tsplot(x, col=4)
abline(v=525.5, col=6, lty=2, lwd=2)
mvspec(x[1:525], kernel=bart(2), taper=.5, main='segment 1', col=4, xlim=c(0,.25))
mvspec(x[526:1000], kernel=bart(1), taper=.5, main='segment 2', col=4, xlim=c(0,.25))
##-- end --##

##-- for a real data example try
autoSpec(ENSO, max.period=4)

## End(Not run)

```

bart

Bartlett Kernel

Description

Smoothing (triangular) kernel that decreases one unit from the center.

Usage

```
bart(m)
```

Arguments

<code>m</code>	non-negative integer specifying the kernel width, which is $2m + 1$. If <code>m</code> has length larger than one, the convolution of the kernel is returned.
----------------	--

Details

Uses kernel from the `stats` package to construct a Bartlett (triangular) kernel of width $2m + 1$; see `help(kernel)` for further details.

Value

Returns an object of class `tskernel` with the coefficients, the kernel dimension, and attribute "Bartlett".

Examples

```
plot(bart(4), ylim=c(0,.2))
```

BCJ

Daily Returns of Three Banks

Description

Daily returns of three banks, 1. Bank of America [boa], 2. Citibank [citi], and 3. JP Morgan Chase [jpm], from 2005 to 2017.

Format

The format is: Time-Series [1:3243, 1:3] from 2005 to 2017: -0.01378 -0.01157 -0.00155 -0.01084 0.01252 ... with column names "boa" "citi" "jpm" .

```

beamd	<i>Infrasonic Signal from a Nuclear Explosion</i>
-------	---

Description

Infrasonic signal from a nuclear explosion.

Usage

```
data(beamd)
```

Format

A data frame with 2048 observations (rows) on 3 numeric variables (columns): sensor1, sensor2, sensor3.

Details

This is a data frame consisting of three columns (that are not time series objects). The data are an infrasonic signal from a nuclear explosion observed at sensors on a triangular array.

blood

Daily Blood Work with Missing Values

Description

Multiple time series of measurements made for 91 days on the three variables, log(white blood count) [WBC], log(platelet) [PLT] and hematocrit [HCT]. Missing data code is NA.

Format

Time-Series [1:91, 1:3] from 1 to 91: 2.33 1.89 2.08 1.82 1.82 ...
..\$: NULL ..\$: chr [1:3] "WBC" "PLT" "HCT"

Details

This data set is used in Chapter 6 for a missing data example.

cardox

Monthly Carbon Dioxide Levels at Mauna Loa

Description

Monthly mean carbon dioxide (in ppm) measured at Mauna Loa Observatory, Hawaii. This is an update to co2 in the datasets package.

Format

The format is: Time-Series [1:729] from March, 1958 to November 2018: 315.71 317.45 317.50 317.10 ...

Details

The carbon dioxide data measured as the mole fraction in dry air, on Mauna Loa constitute the longest record of direct measurements of CO₂ in the atmosphere. They were started by C. David Keeling of the Scripps Institution of Oceanography in March of 1958 at a facility of the National Oceanic and Atmospheric Administration. NOAA started its own CO₂ measurements in May of 1974, and they have run in parallel with those made by Scripps since then. Data are reported as a dry mole fraction defined as the number of molecules of carbon dioxide divided by the number of molecules of dry air multiplied by one million (ppm).

ccf2

Cross Correlation

Description

Produces a nice graphic of the sample CCF of two time series. The actual CCF values are returned invisibly.

Usage

```
ccf2(x, y, max.lag = NULL, main = NULL, ylab = "CCF", plot = TRUE,
      na.action = na.pass, type = c("correlation", "covariance"), ...)
```

Arguments

<code>x, y</code>	univariate time series
<code>max.lag</code>	maximum lag for which to calculate the CCF
<code>main</code>	plot title - if NULL, uses x and y names
<code>ylab</code>	vertical axis label; default is 'CCF'
<code>plot</code>	if TRUE (default) a graphic is produced and the values are returned invisibly. Otherwise, the values are returned.
<code>na.action</code>	how to handle missing values; default is <code>na.pass</code>
<code>type</code>	default is cross-correlation; an option is cross-covariance
<code>...</code>	additional arguments passed to <code>tsplot</code>

Details

This will produce a graphic of the sample $\text{corr}[x(t+\text{lag}), y(t)]$ from $-\text{max.lag}$ to max.lag . Also, the (rounded) values of the CCF are returned invisibly unless `plot=FALSE`. Similar details apply to the cross-covariance.

climhyd

Lake Shasta inflow data

Description

Lake Shasta inflow data. This is a data frame.

Format

A data frame with 454 observations (rows) on the following 6 numeric variables (columns): Temp, DewPt, CldCvr, WndSpd, Precip, Inflow.

Details

The data are 454 months of measured values for the climatic variables: air temperature, dew point, cloud cover, wind speed, precipitation, and inflow, at Lake Shasta, California. The man-made lake is famous for the placard stating, "We don't swim in your toilet, so don't pee in our lake."

`detrend`*Detrend a Time Series*

Description

Returns a time series with the trend removed. The trend can be estimated using polynomial regression or using a lowess fit.

Usage

```
detrend(series, order = 1, lowess = FALSE, lowspan = 2/3)
```

Arguments

<code>series</code>	The time series to be detrended.
<code>order</code>	Order of the polynomial used to estimate the trend with a linear default (order=1) unless lowess is TRUE.
<code>lowess</code>	If TRUE, lowess is used to find the trend. The default is FALSE.
<code>lowspan</code>	The smoother span used for lowess.

Value

The detrended series is returned.

dna2vector	<i>Convert DNA Sequence to Indicator Vectors</i>
------------	--

Description

Takes a DNA sequence (string) of general form (e.g., FASTA) and converts it to a sequence of indicator vectors for use with the Spectral Envelope (specenv).

Usage

```
dna2vector(data, alphabet = NULL)
```

Arguments

data	A DNA sequence as a single string.
alphabet	The particular alphabet being used. The default is <code>alphabet=c("A", "C", "G", "T")</code> .

Details

Takes a string of categories and converts it to a matrix of indicators. The data can then be used by the script [specenv](#), which calculates the Spectral Envelope of the sequence (or subsequence). Many different type of sequences can be used, including FASTA and GenBank, as long as the data is a string of categories.

The indicator vectors (as a matrix) are returned invisibly in case the user forgets to put the results in an object wherein the screen would scroll displaying the entire sequence. In other words, the user should do something like `xdata = dna2vector(data)` where `data` is the original sequence.

As an example, if the DNA sequence is in a FASTA file, say `sequence.fasta`, remove the first line which will look like `>V01555.2`. Then the following code can be used to read the data into the session, create the indicator sequence and save it as a compressed R data file:

```
fileName <- 'sequence.fasta'      # name of FASTA file
data      <- readChar(fileName, file.info(fileName)$size) # input the sequence
myseq     <- dna2vector(data)     # convert it to indicators

##== and if you want to compress and save the data ==##
save(myseq, file='myseq.rda')
##== and then load it when needed ==##
load('myseq.rda')
```

Value

matrix of indicator vectors; returned invisibly

Author(s)

D.S. Stoffer

EM

*EM Algorithm for State Space Models***Description**

Estimation of the parameters in general linear state space models via the EM algorithm. Missing data may be entered as NA or as zero (0). Inputs in both the state and observation equations are allowed. This script replaces EM0 and EM1.

Usage

```
EM(y, A, mu0, Sigma0, Phi, Q, R, Ups = NULL, Gam = NULL, input = NULL,
   max.iter = 100, tol = 1e-04)
```

Arguments

y	data matrix (n x q), vector or time series, n = number of observations, q = number of series. Use NA or zero (0) for missing data.
A	measurement matrices; can be constant or an array with dimension dim=c(q,p,n) if time varying. Use NA or zero (0) for missing data.
mu0	initial state mean vector (p x 1)
Sigma0	initial state covariance matrix (p x p)
Phi	state transition matrix (p x p)
Q	state error matrix (p x p)
R	observation error matrix (q x q - diagonal only)
Ups	state input matrix (p x r); leave as NULL (default) if not needed
Gam	observation input matrix (q x r); leave as NULL (default) if not needed
input	NULL (default) if not needed or a matrix (n x r) of inputs having the same row dimension (n) as y
max.iter	maximum number of iterations
tol	relative tolerance for determining convergence

Details

This script replaces EM0 and EM1 by combining all cases and allowing inputs in the state and observation equations. It uses version 1 of the new [Ksmooth](#) script (hence correlated errors is not allowed).

The states x_t are p-dimensional, the data y_t are q-dimensional, and the inputs u_t are r-dimensional for $t = 1, \dots, n$. The initial state is $x_0 \sim N(\mu_0, \Sigma_0)$.

The general model is

$$\begin{aligned} x_t &= \Phi x_{t-1} + \Upsilon u_t + w_t & w_t &\sim iid N(0, Q) \\ y_t &= A_t x_{t-1} + \Gamma u_t + v_t & v_t &\sim iid N(0, R) \end{aligned}$$

where $w_t \perp v_t$. The observation noise covariance matrix is assumed to be diagonal and it is forced to diagonal otherwise.

The measurement matrices A_t can be constant or time varying. If time varying, they should be entered as an array of dimension dim = c(q,p,n). Otherwise, just enter the constant value making sure it has the appropriate $q \times p$ dimension.

Value

Phi	Estimate of Phi
Q	Estimate of Q
R	Estimate of R
Ups	Estimate of Upsilon (NULL if not used)
Gam	Estimate of Gamma (NULL if not used)
mu0	Estimate of initial state mean
Sigma0	Estimate of initial state covariance matrix
like	-log likelihood at each iteration
niter	number of iterations to convergence
cvg	relative tolerance at convergence

Note

The script does not allow for constrained estimation directly, however, constrained estimation is possible with some extra manipulations. There is an example of constrained estimation using EM at [FUN WITH ASTSA](#), where the fun never stops.

ENSO

El Nino - Southern Oscillation

Description

Southern Oscillation Index (SOI), 1/1951 to 10/2022; anomalies are departures from the 1981-2010 base period.

Format

The format is: Time-Series [1:862] from 1951 to 2022: 1.5 0.9 -0.1 -0.3 -0.7 0.2 -1 -0.2 -1.1 -1 ...

Details

The El Niño - Southern Oscillation (ENSO) is a recurring climate pattern involving changes in the temperature of waters in the central and eastern tropical Pacific Ocean.

The data have been detrended and seasonally adjusted. For raw SOI data (from a different time period), see [soi](#).

eqexp

*Earthquake and Explosion Seismic Series***Description**

This is a data frame of the earthquake and explosion seismic series used throughout the text.

Format

A data frame with 2048 observations (rows) on 17 variables (columns). Each column is a numeric vector.

Details

The matrix has 17 columns, the first eight are earthquakes, the second eight are explosions, and the last column is the Novaya Zemlya event of unknown origin.

The column names are: EQ1, EQ2, ..., EQ8; EX1, EX2, ..., EX8; NZ. The first 1024 observations correspond to the P wave, the second 1024 observations correspond to the S wave.

ESS	<i>Effective Sample Size (ESS)</i>
-----	------------------------------------

Description

Estimates the ESS of a given vector of samples.

Usage

```
ESS(trace, tol = 1e-08)
```

Arguments

trace	vector of sampled values from an MCMC run (univariate only)
tol	ESS is returned as zero if the estimated spectrum at frequency zero is less than this value

Details

Uses [spec.ic](#) to estimate the spectrum of the input at frequency zero (spec0). Then, ESS is estimated as $ESS = \text{length}(\text{trace}) * \text{var}(\text{trace}) / \text{spec0}$.

Value

Returns the estimated ESS of the input.

FDR

*Basic False Discovery Rate***Description**

Computes the basic false discovery rate given a vector of p-values and returns the index of the maximal p-value satisfying the FDR condition.

Usage

```
FDR(pvals, qlevel = 0.05)
```

Arguments

pvals	a vector of pvals on which to conduct the multiple testing
qlevel	the proportion of false positives desired

Value

`fdr.id` NULL if no significant tests, or the index of the maximal p-value satisfying the FDR condition.

Note

This is used primarily in Chapter 7.

Source

Built off of <https://www.stat.berkeley.edu/~paciorek/code/fdr/fdr.R>.

ffbs

*Forward Filtering Backward Sampling***Description**

FFBS algorithm for state space models

Usage

```
ffbs(y, A, mu0, Sigma0, Phi, sQ, sR, Ups = NULL, Gam = NULL, input = NULL)
```

Arguments

<code>y</code>	Data matrix, vector or time series.
<code>A</code>	Observation matrix. Can be constant or an array with $\text{dim}=c(q,p,n)$ if time varying.
<code>mu0</code>	Initial state mean.
<code>Sigma0</code>	Initial state covariance matrix.
<code>Phi</code>	State transition matrix.
<code>sQ</code>	State error covariance matrix is $Q = sQ \%*\% t(sQ)$ – see details below. In the univariate case, it is the standard deviation.
<code>sR</code>	Observation error covariance matrix is $R = sR \%*\% t(sR)$ – see details below. In the univariate case, it is the standard deviation.
<code>Ups</code>	State input matrix.
<code>Gam</code>	Observation input matrix.
<code>input</code>	matrix or vector of inputs having the same row dimension as <code>y</code> .

Details

Refer to Section 6.12 of edition 4 text. For a linear state space model, the FFBS algorithm provides a way to sample a state sequence $x_{0:n}$ from the posterior $\pi(x_{0:n} \mid \Theta, y_{1:n})$ with parameters Θ and data $y_{1:n}$ as described in Procedure 6.1.

The general model is

$$x_t = \Phi x_{t-1} + \Upsilon u_t + sQ w_t \quad w_t \sim iid N(0, I)$$

$$y_t = A_t x_{t-1} + \Gamma u_t + sR v_t \quad v_t \sim iid N(0, I)$$

where $w_t \perp v_t$. Consequently the state noise covariance matrix is $Q = sQ sQ'$ and the observation noise covariance matrix is $R = sR sR'$ and sQ, sR do not have to be square as long as everything is conformable.

x_t is p-dimensional, y_t is q-dimensional, and u_t is r-dimensional. Note that $sQ w_t$ has to be p-dimensional, but w_t does not, and $sR v_t$ has to be q-dimensional, but v_t does not.

Value

Xs	An array of sampled states
X0n	The sampled initial state (because R is 1-based)

Note

The script uses [kfilter](#). If A_t is constant wrt time, it is not necessary to input an array; see the example.

Examples

```
## Not run:

## -- this is just one pass - see FUN WITH ASTSA for the real fun --##
# generate some data
set.seed(1)
sQ = 1; sR = 3; n = 100
mu0 = 0; Sigma0 = 10; x0 = rnorm(1,mu0,Sigma0)
w = rnorm(n); v = rnorm(n)
```

```

x = c(x0 + sQ*w[1]); y = c(x[1] + sR*v[1]) # initialize
for (t in 2:n){
  x[t] = x[t-1] + sQ*w[t]
  y[t] = x[t] + sR*v[t]
}
## run one pass of FFBS, plot data, states and sampled states
run = ffbs(y, A=1, mu0=0, Sigma0=10, Phi=1, sQ=1, sR=3)
tsplot(cbind(y,run$Xs), spaghetti=TRUE, type='o', col=c(8,4), pch=c(1,NA))
legend('topleft', legend=c("y(t)", "xs(t)"), lty=1, col=c(8,4), bty="n", pch=c(1,NA))

## End(Not run)

```

flu

*Monthly pneumonia and influenza deaths in the U.S., 1968 to 1978.***Description**

Monthly pneumonia and influenza deaths per 10,000 people in the United States for 11 years, 1968 to 1978.

Usage

```
data(flu)
```

Format

The format is: Time-Series [1:132] from 1968 to 1979: 0.811 0.446 0.342 0.277 0.248 ...

References

fmri

*fMRI - complete data set***Description**

Data (as a vector list) from an fMRI experiment in pain, listed by location and stimulus. The data are BOLD signals when a stimulus was applied for 32 seconds and then stopped for 32 seconds. The signal period is 64 seconds and the sampling rate was one observation every 2 seconds for 256 seconds ($n = 128$). The number of subjects under each condition varies.

Details

The LOCATIONS of the brain where the signal was measured were [1] Cortex 1: Primary Somatosensory, Contralateral, [2] Cortex 2: Primary Somatosensory, Ipsilateral, [3] Cortex 3: Secondary Somatosensory, Contralateral, [4] Cortex 4: Secondary Somatosensory, Ipsilateral, [5] Caudate, [6] Thalamus 1: Contralateral, [7] Thalamus 2: Ipsilateral, [8] Cerebellum 1: Contralateral and [9] Cerebellum 2: Ipsilateral.

The TREATMENTS or stimuli (and number of subjects in each condition) are [1] Awake-Brush (5 subjects), [2] Awake-Heat (4 subjects), [3] Awake-Shock (5 subjects), [4] Low-Brush (3 subjects), [5] Low-Heat (5 subjects), and [6] Low-Shock (4 subjects). Issue the command `summary(fmri)` for further details. In particular, awake (Awake) or mildly anesthetized (Low) subjects were subjected levels of periodic brushing (Brush), application of heat (Heat), and mild shock (Shock) effects.

As an example, `fmri$L1T6` (Location 1, Treatment 6) will show the data for the four subjects receiving the Low-Shock treatment at the Cortex 1 location; note that `fmri[[6]]` will display the same data.

fmri1

fMRI Data Used in Chapter 1

Description

A data frame that consists of average fMRI BOLD signals at eight locations.

Usage

```
data(fmri1)
```

Format

The format is: mts [1:128, 1:9]

Details

Multiple time series consisting of fMRI BOLD signals at eight locations (in columns 2-9, column 1 is time period), when a stimulus was applied for 32 seconds and then stopped for 32 seconds. The signal period is 64 seconds and the sampling rate was one observation every 2 seconds for 256 seconds ($n = 128$). The columns are labeled: "time" "cort1" "cort2" "cort3" "cort4" "thal1" "thal2" "cere1" "cere2".

[gdp](#)

Description

Adds a grid to an existing plot with major and minor ticks. Works like R graphics `grid()` but the grid lines are solid and gray and minor ticks are produced by default.

Usage

```
Grid(nx = NULL, ny = nx, col = gray(0.9), lty = 1, lwd = par("lwd"), equilogs = TRUE,
     minor = TRUE, nxm = 2, nym = 2, tick.ratio = 0.5, xm.grid = TRUE, ym.grid = TRUE, ...)
```

Arguments

<code>nx, ny</code>	number of cells of the grid in x and y direction. When NULL, as per default, the grid aligns with the tick marks on the corresponding default axis (i.e., tickmarks as computed by <code>axTicks</code>). When NA, no grid lines are drawn in the corresponding direction.
<code>col</code>	color of the grid lines.
<code>lty</code>	line type of the grid lines.
<code>lwd</code>	line width of the grid lines.
<code>equilogs</code>	logical, only used when log coordinates and alignment with the axis tick marks are active. Setting <code>equilogs = FALSE</code> in that case gives non equidistant tick aligned grid lines.
<code>minor</code>	logical with TRUE (default) adding minor ticks.
<code>nxm, nym</code>	number of intervals in which to divide the area between major tick marks on the x-axis (y-axis). If <code>minor=TRUE</code> , should be > 1 or no minor ticks will be drawn.
<code>tick.ratio</code>	ratio of lengths of minor tick marks to major tick marks. The length of major tick marks is retrieved from <code>par("tck")</code> .
<code>xm.grid, ym.grid</code>	if TRUE (default), adds grid lines at minor x-axis, y-axis ticks.
<code>...</code>	other graphical parameters;

Author(s)

D.S. Stoffer

Source

The code for `grid()` in R graphics and `minor.tick()` from the Hmisc package were combined.

Hare

Snowshoe Hare

Description

This is one of the classic studies of predator-prey interactions, the 90-year data set is the number, in thousands, of snowshoe hare pelts purchased by the Hudson's Bay Company of Canada. While this is an indirect measure of predation, the assumption is that there is a direct relationship between the number of pelts collected and the number of hare and lynx in the wild.

Usage

```
data("Hare")
```

Format

The format is: Time-Series [1:91] from 1845 to 1935: 19.6 19.6 19.6 12 28 ...

Note

This data set pairs with [Lynx](#). The data are in units of one thousand.

Kfilter	<i>Quick Kalman Filter</i>
---------	----------------------------

Description

Returns both the predicted and filtered values for various linear state space models; it also evaluates the likelihood at the given parameter values. This script replaces Kfilter0, Kfilter1, and Kfilter2

Usage

```
Kfilter(y, A, mu0, Sigma0, Phi, sQ, sR, Ups = NULL, Gam = NULL,
        input = NULL, S = NULL, version = 1)
```

Arguments

y	data matrix (n x q), vector or time series, n = number of observations. Use NA or zero (0) for missing data.
A	can be constant or an array with dimension $\text{dim}=c(q,p,n)$ if time varying (see details). Use NA or zero (0) for missing data.
mu0	initial state mean vector (p x 1)
Sigma0	initial state covariance matrix (p x p)
Phi	state transition matrix (p x p)
sQ	state error pre-matrix (see details)
sR	observation error pre-matrix (see details)
Ups	state input matrix (p x r); leave as NULL (default) if not needed
Gam	observation input matrix (q x r); leave as NULL (default) if not needed
input	NULL (default) if not needed or a matrix (n x r) of inputs having the same row dimension (n) as y
S	covariance matrix (p x q) between state and observation errors; not necessary to specify if not needed and only used if version=2.
version	either 1 (default) or 2; version 2 allows for correlated errors

Details

This script replaces `Kfilter0`, `Kfilter1`, and `Kfilter2` by combining all cases. The major difference is how to specify the covariance matrices; in particular, $sQ = t(cQ)$ and $sR = t(cR)$ where cQ and cR were used in `Kfilter0-1-2` scripts.

The states x_t are p -dimensional, the data y_t are q -dimensional, and the inputs u_t are r -dimensional for $t = 1, \dots, n$. The initial state is $x_0 \sim N(\mu_0, \Sigma_0)$.

The measurement matrices A_t can be constant or time varying. If time varying, they should be entered as an array of dimension $\text{dim} = c(q, p, n)$. Otherwise, just enter the constant value making sure it has the appropriate $q \times p$ dimension.

Version 1 (default): The general model is

$$x_t = \Phi x_{t-1} + \Upsilon u_t + sQ w_t \quad w_t \sim iid N(0, I)$$

$$y_t = A_t x_{t-1} + \Gamma u_t + sR v_t \quad v_t \sim iid N(0, I)$$

where $w_t \perp v_t$. Consequently the state noise covariance matrix is $Q = sQ sQ'$ and the observation noise covariance matrix is $R = sR sR'$ and sQ, sR do not have to be square as long as everything is conformable. Notice the specification of the state and observation covariances has changed from the original scripts.

NOTE: If it is easier to model in terms of Q and R , simply input the square root matrices $sQ = Q^{.5}$ and $sR = R^{.5}$.

Version 2 (correlated errors): The general model is

$$x_{t+1} = \Phi x_t + \Upsilon u_{t+1} + sQ w_t \quad w_t \sim iid N(0, I)$$

$$y_t = A_t x_{t-1} + \Gamma u_t + sR v_t \quad v_t \sim iid N(0, I)$$

where $\text{Cov}(w_t, v_t) = S$.

NOTE: If it is easier to model in terms of Q and R , simply input the square root matrices $sQ = Q^{.5}$ and $sR = R^{.5}$.

Note that in either version, $sQ w_t$ has to be p -dimensional, but w_t does not, and $sR v_t$ has to be q -dimensional, but v_t does not.

Value

Time varying values are returned as arrays.

<code>Xp</code>	one-step-ahead prediction of the state
<code>Pp</code>	mean square prediction error
<code>Xf</code>	filter value of the state
<code>Pf</code>	mean square filter error
<code>like</code>	the negative of the log likelihood
<code>innov</code>	innovation series
<code>sig</code>	innovation covariances
<code>Kn</code>	last value of the gain, needed for smoothing

Note

Note that Kfilter is similar to Kfilter-0-1-2 except that only the essential values need to be entered (and come first in the statement); the optional values such as input are set to NULL by default if they are not needed. This version is faster than the older versions. The biggest change was to how the covarainces are specified. For example, if you have code that used Kfilter1, just use $sQ = t(cQ)$ and $sR = t(cR)$ here.

NOTE: If it is easier to model in terms of Q and R , simply input the square root matrices $sQ = Q^{.5}$ and $sR = R^{.5}$.

Examples

```
# generate some data
set.seed(1)
sQ = 1; sR = 3; n = 100
mu0 = 0; Sigma0 = 10; x0 = rnorm(1,mu0,Sigma0)
w = rnorm(n); v = rnorm(n)
x = c(x0 + sQ*w[1]); y = c(x[1] + sR*v[1]) # initialize
for (t in 2:n){
  x[t] = x[t-1] + sQ*w[t]
  y[t] = x[t] + sR*v[t]
}
# run and plot the filter
run = Kfilter(y, A=1, mu0, Sigma0, Phi=1, sQ, sR)
tsplot(cbind(y,run$Xf), spaghetti=TRUE, type='o', col=c(4,6), pch=c(1,NA), margins=1)
# CRAN tests need extra white space :( so margins=1 is not necessary otherwise
legend('topleft', legend=c("y(t)","Xf(t)"), lty=1, col=c(4,6), bty="n", pch=c(1,NA))
```

Description

Returns the smoother values for various linear state space models. The predicted and filtered values and the likelihood at the given parameter values are also returned (via Kfilter). This script replaces Ksmooth0, Ksmooth1, and Ksmooth2.

Usage

```
Ksmooth(y, A, mu0, Sigma0, Phi, sQ, sR, Ups = NULL, Gam = NULL,
        input = NULL, S = NULL, version = 1)
```

Arguments

y	data matrix (n x q), vector or time series, n = number of observations. Use NA or zero (0) for missing data.
A	can be constant or an array with dimension dim=c(q,p,n) if time varying (see details). Use NA or zero (0) for missing data.
mu0	initial state mean vector (p x 1)
Sigma0	initial state covariance matrix (p x p)
Phi	state transition matrix (p x p)
sQ	state error pre-matrix (see details)
sR	observation error pre-matrix (see details)
Ups	state input matrix (p x r); leave as NULL (default) if not needed
Gam	observation input matrix (q x r); leave as NULL (default) if not needed
input	NULL (default) if not needed or a matrix (n x r) of inputs having the same row dimension (n) as y
S	covariance matrix (p x q) between state and observation errors; not necessary to specify if not needed and only used if version=2.
version	either 1 (default) or 2; version 2 allows for correlated errors

Details

This script replaces Ksmooth0, Ksmooth1, and Ksmooth2 by combining all cases. The major difference is how to specify the covariance matrices; in particular, $sQ = t(cQ)$ and $sR = t(cR)$ where cQ and cR were used in Kfilter0-1-2 scripts.

The states x_t are p-dimensional, the data y_t are q-dimensional, and the inputs u_t are r-dimensional for $t = 1, \dots, n$. The initial state is $x_0 \sim N(\mu_0, \Sigma_0)$.

The measurement matrices A_t can be constant or time varying. If time varying, they should be entered as an array of dimension $\text{dim} = c(q, p, n)$. Otherwise, just enter the constant value making sure it has the appropriate $q \times p$ dimension.

Version 1 (default): The general model is

$$x_t = \Phi x_{t-1} + \Upsilon u_t + sQ w_t \quad w_t \sim iid N(0, I)$$

$$y_t = A_t x_{t-1} + \Gamma u_t + sR v_t \quad v_t \sim iid N(0, I)$$

where $w_t \perp v_t$. Consequently the state noise covariance matrix is $Q = sQ sQ'$ and the observation noise covariance matrix is $R = sR sR'$ and sQ, sR do not have to be square as long as everything is conformable. Notice the specification of the state and observation covariances has changed from the original scripts.

NOTE: If it is easier to model in terms of Q and R , simply input the square root matrices $sQ = Q^{.5}$ and $sR = R^{.5}$.

Version 2 (correlated errors): The general model is

$$x_{t+1} = \Phi x_t + \Upsilon u_{t+1} + sQ w_t \quad w_t \sim iid N(0, I)$$

$$y_t = A_t x_{t-1} + \Gamma u_t + sR v_t \quad v_t \sim iid N(0, I)$$

where $\text{Cov}(w_t, v_t) = S$.

NOTE: If it is easier to model in terms of Q and R , simply input the square root matrices $sQ = Q^{.5}$ and $sR = R^{.5}$.

Note that in either version, $sQ w_t$ has to be p-dimensional, but w_t does not, and $sR v_t$ has to be q-dimensional, but v_t does not.

Value

Time varying values are returned as arrays.

Xs	state smoothers
Ps	smoother mean square error
X0n	initial mean smoother
P0n	initial smoother covariance
J0	initial value of the J matrix
J	the J matrices
Xp	state predictors
Pp	mean square prediction error
Xf	state filters
Pf	mean square filter error
like	negative of the log likelihood
innov	innovation series
sig	innovation covariances
Kn	the value of the last Gain

Note

Note that Ksmooth is similar to Ksmooth-0-1-2 except that only the essential values need to be entered (and come first in the statement); the optional values such as input are set to NULL by default if they are not needed. This version is faster than the older versions. The biggest change was to how the covarainces are specified. For example, if you have code that used Ksmooth1, just use $sQ = t(cQ)$ and $sR = t(cR)$ here.

lag1.plot

*Lag Plot - one time series***Description**

Produces a grid of scatterplots of a series versus lagged values of the series.

Usage

```
lag1.plot(series, max.lag=1, corr=TRUE, smooth=TRUE, col=gray(.1),
          lw1=1, bgl='white', ltcol=1, box.col=8, ...)
```

Arguments

series	the data
max.lag	maximum lag
corr	if TRUE, shows the autocorrelation value in a legend
smooth	if TRUE, adds a lowess fit to each scatterplot
col	color of points; default is gray(.1)
lw1	width of lowess line; default is 1
bgl	background of the ACF legend; default is 'white'
ltcol	legend text color; default is black
box.col	color of the border of the ACF legend; default is 'gray(62)'
...	additional graphical arguments

LagReg

Lagged Regression

Description

Performs lagged regression as discussed in Chapter 4.

Usage

```
LagReg(input, output, L = c(3, 3), M = 40, threshold = 0,
       inverse = FALSE)
```

Arguments

input	input series
output	output series
L	degree of smoothing; see spans in the help file for spec.pgram.
M	must be even; number of terms used in the lagged regression
threshold	the cut-off used to set small (in absolute value) regression coefficients equal to zero
inverse	if TRUE, will fit a forward-lagged regression

Details

For a bivariate series, input is the input series and output is the output series. The degree of smoothing for the spectral estimate is given by L; see spans in the help file for spec.pgram. The number of terms used in the lagged regression approximation is given by M, which must be even. The threshold value is the cut-off used to set small (in absolute value) regression coefficients equal to zero (it is easiest to run LagReg twice, once with the default threshold of zero, and then again after inspecting the resulting coefficients and the corresponding values of the CCF). Setting inverse=TRUE will fit a forward-lagged regression; the default is to run a backward-lagged regression. The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

Value

Graphs of the estimated impulse response function, the CCF, and the output with the predicted values superimposed.

beta	Estimated coefficients
fit	The output series, the fitted values, and the residuals

Note

See Chapter 4 of the text for an example.

Lynx

Canadian Lynx

Description

This is one of the classic studies of predator-prey interactions, the 90-year data set is the number, in thousands, of lynx pelts purchased by the Hudson's Bay Company of Canada. While this is an indirect measure of predation, the assumption is that there is a direct relationship between the number of pelts collected and the number of hare and lynx in the wild.

Usage

```
data("Lynx")
```

Format

The format is: Time-Series [1:91] from 1845 to 1935: 30.1 45.1 49.1 39.5 21.2 ...

Note

The data are in units of one thousand. This data set pairs with [Hare](#) and is NOT the same as [lynx](#).

matrixpwr*Powers of a Square Matrix*

Description

matrixpwr computes powers of a square matrix including negative powers for nonsingular matrices.

%% is a more intuitive interface as an operator.

Usage

```
matrixpwr(A, power)
```

```
A %% power
```

Arguments

A a square matrix

power single numeric

Details

Raises matrix to the specified power. The matrix must be square and if $\text{power} < 0$, the matrix must be nonsingular.

Note that %% is defined as `"%%" <- function(A, power) matrixpwr(A, power)`

If $\text{power} = 0$, the identity matrix is returned.

Value

Returns matrix raised to the given power.

P %%% 50

# surround with parentheses if used in an expression
c(.5,.5) %*% (P%%50)

# Inverse square root
Q = var(econ5)
Q %%% -.5
```

Months	<i>Month Labels</i>
--------	---------------------

Description

Provides labels for the (English) months of the year to be used in plotting monthly time series.

Format

The format is: chr [1:12] "J" "F" "M" "A" "M" "J" "J" "A" "S" "O" "N" "D"

Note

Hi Kids. The months of the year in English are:

January, February, March, April, May, June, July, August, September, October, November, December.

References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts and some help on using R for time series analysis can be found at <https://nickpoison.github.io/>.

Examples

```
sAR = sarima.sim(sar=.9, S=12, n=36)
tsplot(sAR, type='c')
points(sAR, pch=Months, cex=1.1, font=4, col=1:4)
```

Description

This is `spec.pgram` with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as `fxx`. The bandwidth calculation has been changed to the more practical definition given in the text and this can be used to replace `spec.pgram`.

Usage

```
mvspec(x, spans = NULL, kernel = NULL, taper = 0, pad = 0,
       fast = TRUE, demean = FALSE, detrend = TRUE,
       plot = TRUE, log='n', type = NULL, na.action = na.fail,
       nxm=2, nym=1, main=NULL, ...)
```

Arguments

<code>x</code>	univariate or multivariate time series (i.e., the <code>p</code> columns of <code>x</code> are time series)
<code>spans</code>	specify smoothing; same as <code>spec.pgram</code>
<code>kernel</code>	specify kernel; same as <code>spec.pgram</code>
<code>taper</code>	specify taper; same as <code>spec.pgram</code> with different default
<code>pad</code>	specify padding; same as <code>spec.pgram</code>
<code>fast</code>	specify use of FFT; same as <code>spec.pgram</code>
<code>demean</code>	if TRUE, series is demeaned first; same as <code>spec.pgram</code>
<code>detrend</code>	if TRUE, series is detrended first; same as <code>spec.pgram</code>
<code>plot</code>	plot the estimate; same as <code>spec.pgram</code>
<code>log</code>	same as <code>spec.pgram</code> but default is 'no'
<code>type</code>	type of plot to be drawn, defaults to lines
<code>na.action</code>	same as <code>spec.pgram</code>
<code>nxm, nym</code>	the number of minor tick mark divisions on x-axis, y-axis; the default is one minor tick on the x-axis and none on the y-axis
<code>main</code>	title of the graphics; if NULL, a suitable title is generated
<code>...</code>	graphical arguments passed to <code>plot.spec</code>

Details

This is built off of `spec.pgram` from the stats package with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as `fxx`. The default for the plot is NOT to plot on a log scale and the graphic will have a grid. The bandwidth calculation has been changed to the more practical definition given in the text, $(L_h/n.used) * frequency(x)$. Also, the bandwidth is no longer displayed in the graphic. Although meant to be used to easily obtain multivariate spectral estimates, this script can be used for univariate time series. Note that the script does not taper by default (`taper=0`); this forces the user to do "conscious tapering".

Value

An object of class "spec", which is a list containing at least the following components:

fxx	spectral matrix estimates; an array of dimensions $\text{dim} = c(p, p, \text{nfreq})$
freq	vector of frequencies at which the spectral density is estimated.
spec	vector (for univariate series) or matrix (for multivariate series) of estimates of the spectral density at frequencies corresponding to freq.
details	matrix with columns: frequency, period, spectral ordinate(s)
coh	NULL for univariate series. For multivariate time series, a matrix containing the squared coherency between different series. Column $i + (j - 1) * (j - 2) / 2$ of coh contains the squared coherency between columns i and j of x , where $i < j$.
phase	NULL for univariate series. For multivariate time series a matrix containing the cross-spectrum phase between different series. The format is the same as coh.
Lh	Number of frequencies (approximate) used in the band.
n.used	Sample length used for the FFT
df	Degrees of freedom (may be approximate) associated with the spectral estimate.
bandwidth	Bandwidth (may be approximate) associated with the spectral estimate.
method	The method used to calculate the spectrum.

The results are returned invisibly if plot is true.

[salt](#)

 sarima

Fit ARIMA Models

Description

Fits ARIMA models (with diagnostics) in a short command. It can also be used to perform regression with autocorrelated errors.

Usage

```
sarima(xdata, p, d, q, P = 0, D = 0, Q = 0, S = -1,
       details = TRUE, xreg=NULL, Model=TRUE,
       fixed=NULL, tol = sqrt(.Machine$double.eps),
       no.constant = FALSE, ...)
```

Arguments

xdata	univariate time series
p	AR order (must be specified)
d	difference order (must be specified)
q	MA order (must be specified)
P	SAR order; use only for seasonal models
D	seasonal difference; use only for seasonal models
Q	SMA order; use only for seasonal models
S	seasonal period; use only for seasonal models
xreg	Optionally, a vector or matrix of external regressors, which must have the same number of rows as xdata.
Model	if TRUE (default), the model orders are printed on the diagnostic plot.
fixed	optional numeric vector of the same length as the total number of parameters. If supplied, only parameters corresponding to NA entries will be estimated.
details	if FALSE, turns off the diagnostic plot and the output from the nonlinear optimization routine, which is <code>optim</code> . The default is TRUE.
tol	controls the relative tolerance (<code>reltol</code> in <code>optim</code>) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default.
no.constant	controls whether or not <code>sarima</code> includes a constant in the model. In particular, if there is no differencing (<code>d = 0</code> and <code>D = 0</code>) you get the mean estimate. If there is differencing of order one (either <code>d = 1</code> or <code>D = 1</code> , but not both), a constant term is included in the model. These two conditions may be overridden (i.e., no constant will be included in the model) by setting this to TRUE; e.g., <code>sarima(x, 1, 1, 0, no.constant=TRUE)</code> . Otherwise, no constant or mean term is included in the model. If regressors are included (via <code>xreg</code>), this is ignored.
...	additional graphical arguments

Details

If your time series is in `x` and you want to fit an ARIMA(p,d,q) model to the data, the basic call is `sarima(x,p,d,q)`. The values p,d,q , must be specified as there is no default. The results are the parameter estimates, standard errors, AIC, AICc, BIC (as defined in Chapter 2) and diagnostics. To fit a seasonal ARIMA model, the basic call is `sarima(x,p,d,q,P,D,Q,S)`. For example, `sarima(x,2,1,0)` will fit an ARIMA(2,1,0) model to the series in `x`, and `sarima(x,2,1,0,0,1,1,12)` will fit a seasonal ARIMA(2,1,0) * (0,1,1)₁₂ model to the series in `x`. The difference between the information criteria given by `sarima()` and `arima()` is that they differ by a scaling factor of the effective sample size.

Value

<code>fit</code>	the arima object
<code>degrees_of_freedom</code>	Error degrees of freedom
<code>ttable</code>	a little t-table with two-sided p-values
<code>AIC</code>	value of the AIC - all ICs are the values reported in <code>fit</code> divided by the essential number of observations (after differencing)
<code>AICc</code>	value of the AICc
<code>BIC</code>	value of the BIC

References

Examples

```
# easy to use
sarima(rec,2,0,0) # data, p, d, and q
sarima(rec, 2,0,0, details=FALSE)$ttable # print t-table only

(dog <- sarima(log(AirPassengers), 0,1,1, 0,1,1,12))
str(dog$fit, vec.len=1) # fit has all the returned arima values
tsplot(resid(dog$fit)) # plot the innovations (residuals)

# fixed parameters
x = sarima.sim( ar=c(0,-.9), n=200 ) + 50
sarima(x, 2,0,0, fixed=c(0,NA,NA)) # phi1 fixed, phi2 and mean free

# fun with diagnostics
sarima(log(AirPassengers), 0,1,1, 0,1,1,12, gg=TRUE, col=4)
```

sarima.for

ARIMA Forecasting

Description

ARIMA forecasting.

Usage

```
sarima.for(xdata,n.ahead,p,d,q,P=0,D=0,Q=0,S=-1,tol=sqrt(.Machine$double.eps),
           no.constant=FALSE, plot=TRUE, plot.all=FALSE,
           xreg = NULL, newxreg = NULL, fixed=NULL, ...)
```

Arguments

xdata	univariate time series
n.ahead	forecast horizon (number of periods)
p	AR order
d	difference order
q	MA order
P	SAR order; use only for seasonal models
D	seasonal difference; use only for seasonal models
Q	SMA order; use only for seasonal models
S	seasonal period; use only for seasonal models
tol	controls the relative tolerance (reltol) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default.
no.constant	controls whether or not a constant is included in the model. If <code>no.constant=TRUE</code> , no constant is included in the model. See sarima for more details.
plot	if TRUE (default) the data (or some of it) and the forecasts and bounds are plotted
plot.all	if TRUE, all the data are plotted in the graphic; otherwise, only the last 100 observations are plotted in the graphic.
xreg	Optionally, a vector or matrix of external regressors, which must have the same number of rows as the series. If this is used, <code>newxreg</code> MUST be specified.
newxreg	New values of <code>xreg</code> to be used for prediction. Must have at least <code>n.ahead</code> rows.
fixed	optional numeric vector of the same length as the total number of parameters. If supplied, only parameters corresponding to NA entries will be estimated.
...	additional graphical arguments

Details

For example, `sarima.for(x,5,1,0,1)` will forecast five time points ahead for an ARMA(1,1) fit to `x`. The output prints the forecasts and the standard errors of the forecasts, and supplies a graphic of the forecast with +/- 1 and 2 prediction error bounds.

Value

pred	the forecasts
se	the prediction (standard) errors

sarima.for(log(AirPassengers),12,0,1,1,0,1,1,12, gg=TRUE, col=4, main='arf')

# with regressors:
nummy = length(soi)
n.ahead = 24
nureg = time(soi)[nummy] + seq(1,n.ahead)/12
sarima.for(soi,n.ahead,2,0,0,2,0,0,12, xreg=time(soi), newxreg=nureg)
```

sarima.sim

ARIMA Simulation

Description

Simulate data from (seasonal) ARIMA models.

Usage

```
sarima.sim(ar = NULL, d = 0, ma = NULL, sar = NULL, D = 0, sma = NULL, S = NULL,
           n = 500, rand.gen = rnorm, innov = NULL, burnin = NA, t0 = 0, ...)
```

Arguments

ar	coefficients of AR component (does not have to be specified)
d	order of regular difference (does not have to be specified)
ma	coefficients of MA component (does not have to be specified)
sar	coefficients of SAR component (does not have to be specified)
D	order of seasonal difference (does not have to be specified)

sma	coefficients of SMA component (does not have to be specified)
S	seasonal period (does not have to be specified)
n	desired sample size (defaults to 500)
rand.gen	optional; a function to generate the innovations (defaults to normal)
innov	an optional times series of innovations. If not provided, rand.gen is used.
burnin	length of burn-in (a non-negative integer). If NA (the default) a reasonable value is selected.
t0	start time (defaults to 0)
...	additional arguments applied to the innovations. For rand.gen, the standard deviation of the innovations generated by rnorm can be specified by sd or the mean by mean (see details and examples). In addition, rand.gen may be overridden using a preset sequence of innovations specifying innov (see details and examples).

Details

Will generate a time series of length n from the specified SARIMA model using simplified input.

The use of the term mean in ... refers to the generation of normal innovations. For example, `sarima.sim(ar=.9, mean=5)` will generate data using $N(5,1)$ or $5+N(0,1)$ innovations, so that the constant in the model is 5 and the mean of the AR model is $5/(1-.9) = 50$. In `sarima.sim(ma=.9, mean=5)`, however, the model mean is 5 (the constant). Also, a random walk with drift = .1 can be generated by `sarima.sim(d=1, mean=.1, burnin=0)`, which is equivalent to `cumsum(rnorm(500, mean=.1))`. The same story goes if sd is specified; i.e., it's applied to the innovations. Because anything specified in ... refers to the innovations, a simpler way to generate a non-zero mean is to add the value outside the call; see the examples.

If innov is used to input the innovations and override rand.gen, be sure that `length(innov)` is at least $n + \text{burnin}$. If the criterion is not met, the script will return less than the desired number of values and a warning will be given.

Value

A time series of length n from the specified SARIMA model with the specified frequency if the model is seasonal and start time t_0 .

Note

The model autoregressive polynomial ('AR side' = AR x SAR) is checked for causality and the model moving average polynomial ('MA side' = MA x SMA) is checked invertibility. The script stops and reports an error at the first violation of causality or invertibility; i.e., it will not report multiple errors.

y = sarima.sim(ar=c(1.5,-.75)) + 50
tsplot(y)

## ARIMA(0,1,1) with drift
tsplot(sarima.sim(ma=-.8, d=1, mean=.1))

## SAR(1) example from text
sAR = sarima.sim(sar=.9, S=12, n=36)
tsplot(sAR, type='c')
points(sAR, pch=Months, cex=1.1, font=4, col=1:4)

## SARIMA(0,1,1)x(0,1,1)_12 - B&J's favorite
tsplot(sarima.sim(d=1, ma=-.4, D=1, sma=-.6, S=12, n=120))

## infinite variance t-errors
tsplot(sarima.sim(ar=.9, rand.gen=function(n, ...) rt(n, df=2) ))

## use your own innovations
dog = rexp(150, rate=.5)*sign(runif(150,-1,1))
tsplot(sarima.sim(n=100, ar=.99, innov=dog, burnin=50))

## generate seasonal data but no P, D or Q - you will receive
## a message to make sure that you wanted to do this on purpose:
tsplot(sarima.sim(ar=c(1.5,-.75), n=144, S=12), ylab='doggy', xaxt='n')
mtext(seq(0,144,12), side=1, line=.5, at=0:12)
```

scatter.hist

Scatterplot with Marginal Histograms

Description

Draws a scatterplot with histograms in the margins.

Usage

```
scatter.hist(x, y, xlab = NULL, ylab = NULL, title = NULL, pt.size = 1,
             hist.col = gray(0.82), pt.col = gray(0.1, 0.25), pch = 19,
             reset.par = TRUE, ...)
```

Arguments

x	vector of x-values
y	corresponding vector of y-values
xlab	x-axis label (defaults to name of x)

<code>ylab</code>	y-axis label (defaults to name of y)
<code>title</code>	plot title (optional)
<code>pt.size</code>	size of points in scatterplot
<code>hist.col</code>	color for histograms
<code>pt.col</code>	color of points in scatterplot
<code>pch</code>	scatterplot point character
<code>reset.par</code>	reset graphics - default is TRUE; set to FALSE to add on to scatterplot
<code>...</code>	other graphical parameters

```

SigExtract

Signal Extraction And Optimal Filtering

Description

Performs signal extraction and optimal filtering as discussed in Chapter 4.

Usage

```
SigExtract(series, L = c(3, 3), M = 50, max.freq = 0.05)
```

Arguments

<code>series</code>	univariate time series to be filtered
<code>L</code>	degree of smoothing (may be a vector); see <code>spans</code> in <code>spec.pgram</code> for more details
<code>M</code>	number of terms used in the lagged regression approximation
<code>max.freq</code>	truncation frequency, which must be larger than $1/M$.

Details

The basic function of the script, and the default setting, is to remove frequencies above 1/20 (and, in particular, the seasonal frequency of 1 cycle every 12 time points). The sampling frequency of the time series is set to unity prior to the analysis.

Value

Returns plots of (1) the original and filtered series, (2) the estimated spectra of each series, (3) the filter coefficients and the desired and attained frequency response function. The filtered series is returned invisibly.

Note

The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

Sleep State and Movement Data - Group 1

Description

Sleep-state and number of movements of infants taken from a study on the effects of prenatal exposure to alcohol. This is Group 1 where the mothers did not drink alcohol during pregnancy.

Format

List of 12 (by subjects) : 'data.frame': 120 obs. of 3 variables: .. min : int [1:120] minute (1 to 120) .. state: int [1:120] sleep state 1 to 6 with NA missing (see details) .. mvmnt: int [1:120] number of movements

Details

Per minute sleep state, for approximately 120 minutes, is categorized into one of six possible states, non-REM: NR1 [1] to NR4 [4], and REM [5], or AWAKE [6]. NA means no state is recorded for that minute (if there, it occurs at end of the session). Group 1 (this group) is from mothers who abstained from drinking during pregnancy. In addition, the number of movements per minute are listed.

spec.ic

Estimate Spectral Density of a Time Series from AR Fit

Description

Fits an AR model to data and computes (and by default plots) the spectral density of the fitted model based on AIC (default) or BIC.

Usage

```
spec.ic(data, BIC = FALSE, order.max = 30, main = NULL, plot = TRUE,
        detrend = FALSE, method=NULL, ...)
```

Arguments

data	a univariate time series.
BIC	if TRUE, fit is based on BIC. If FALSE (default), fit is based on AIC.
order.max	maximum order of models to fit. Defaults to 30.
main	title. Defaults to name of series, method and chosen order.
plot	if TRUE (default) produces a graphic of the estimated AR spectrum.
detrend	if TRUE, detrends the data first. Default is FALSE.
method	method of estimation - a character string specifying the method to fit the model chosen from the following: "yule-walker", "burg", "ols", "mle", "yw". Defaults to "yule-walker".
...	additional arguments.

Details

Uses ar to fit the best AR model based on pseudo AIC or BIC. Using method='mle' will be slow. The minimum centered AIC and BIC values and the spectral and frequency ordinates are returned silently.

Value

[[1]]	Matrix with columns: ORDER, AIC, BIC
[[2]]	Matrix with columns: freq, spec

## End(Not run)
```

specenv

Spectral Envelope

Description

Computes the spectral envelope of categorical-valued or real-valued time series.

Usage

```
specenv(xdata, section = NULL, spans = NULL, kernel = NULL, taper = 0,
        significance = 1e-04, plot = TRUE, ylim = NULL, real = FALSE, ...)
```

Arguments

xdata	For categorical-valued sequences, a matrix with rows that are indicators of the categories represented by the columns, possibly a sequence converted using dna2vector . For real-valued sequences, a matrix with at least two columns that are various transformations of the data.
section	of the form start:end where start < end are positive integers; specifies the section used in the analysis - default is the entire sequence.
spans	specify smoothing used in mvspec.
kernel	specify kernel to be used in mvspec.
taper	specify amount of tapering to be used in mvspec.
significance	significance threshold exhibited in plot - default is .0001; set to NA to cancel
plot	if TRUE (default) a graphic of the spectral envelope is produced
ylim	limits of the spectral envelope axis; if NULL (default), a suitable range is calculated.
real	FALSE (default) for categorical-valued sequences and TRUE for real-valued sequences.
...	other graphical parameters.

Details

Calculates the spectral envelope for categorical-valued series as discussed in https://www.stat.pitt.edu/stoffer/dss_files/spenv.pdf and summarized in

<https://doi.org/10.1214/ss/1009212816>.

Alternately, calculates the spectral envelope for real-valued series as discussed in [https://doi.org/10.1016/S0378-3758\(96\)00044-4](https://doi.org/10.1016/S0378-3758(96)00044-4).

These concepts are also presented (with examples) in Section 7.9 (Chapter 7) of Time Series Analysis and Its Applications: With R Examples: <https://www.stat.pitt.edu/stoffer/tsa4/>.

For categorical-valued series, the input xdata must be a matrix of indicators which is perhaps a sequence preprocessed using [dna2vector](#).

For real-valued series, the input `xdata` should be a matrix whose columns are various transformations of the univariate series.

The script does not detrend the data prior to estimating spectra. If this is an issue, then detrend the data prior to using this script.

Value

By default, will produce a graph of the spectral envelope and an approximate significance threshold. A matrix containing: frequency, spectral envelope ordinates, and (1) the scalings of the categories in the order of the categories in the alphabet or (2) the coefficients of the transformations, is returned invisibly.

ssm

*State Space Model***Description**

Fits a simple univariate state space model to data. The parameters are estimated (the state regression parameter may be fixed). State predictions, filters, and smoothers and corresponding error variances are evaluated at the estimates. The sample size must be at least 20.

Usage

```
ssm(y, A, phi, alpha, sigw, sigv, fixphi = FALSE)
```

Arguments

y	data
A	measurement value (fixed constant)
phi	initial value of phi, may be fixed
alpha	initial value for alpha
sigw	initial value for sigma[w]
sigv	initial value for sigma[v]
fixphi	if TRUE, the phi parameter is fixed

Details

The script works for a specific univariate state space model,

$$x_t = \alpha + \phi x_{t-1} + w_t \quad \text{and} \quad y_t = Ax_t + v_t.$$

The initial state conditions use a default calculation and cannot be specified. The parameter estimates are printed and the script returns the state predictors and smoothers. The regression parameter ϕ may be fixed.

Value

At the MLEs, these are returned invisibly:

Xp	time series - state prediction, x_t^{t-1}
Pp	corresponding MSPEs, P_t^{t-1}
Xf	time series - state filter, x_t^t
Pf	corresponding MSEs, P_t^t
Xs	time series - state smoother, x_t^n
Ps	corresponding MSEs, P_t^n

tsplot(gtemp_land, type='o', col=4)
lines(u$Xs, col=6, lwd=2)

## End(Not run)
```

star	<i>Variable Star</i>
------	----------------------

Description

The magnitude of a star taken at midnight for 600 consecutive days. The data are taken from the classic text, *The Calculus of Observations, a Treatise on Numerical Mathematics*, by E.T. Whittaker and G. Robinson, (1923, Blackie and Son, Ltd.).

Format

The format is: Time-Series [1:600] from 1 to 600: 25 28 31 32 33 33 32 ...

References

stoch.reg	<i>Frequency Domain Stochastic Regression</i>
-----------	---

Description

Performs frequency domain stochastic regression discussed in Chapter 7.

Usage

```
stoch.reg(data, cols.full, cols.red, alpha, L, M, plot.which)
```

Arguments

data	data matrix
cols.full	specify columns of data matrix that are in the full model
cols.red	specify columns of data matrix that are in the reduced model (use NULL if there are no inputs in the reduced model)
alpha	test size
L	smoothing - see spans in spec.pgram
M	number of points in the discretization of the integral
plot.which	coh or F.stat, to plot either the squared-coherencies or the F-statistics, respectively

Value

power.full	spectrum under the full model
power.red	spectrum under the reduced model
Betahat	regression parameter estimates
eF	pointwise (by frequency) F-tests
coh	coherency

Note

See Chapter 7 of the text for examples. The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

sunspotz

Biannual Sunspot Numbers

Description

Biannual smoothed (12-month moving average) number of sunspots from June 1749 to December 1978; n = 459. The "z" on the end is to distinguish this series from the one included with R (called sunspots).

Format

The format is: Time Series: Start = c(1749, 1) End = c(1978, 1) Frequency = 2

SV.mcmc

*Fit Bayesian Stochastic Volatility Model***Description**

Fits a stochastic volatility model to a univariate time series of returns.

Usage

```
SV.mcmc(y, nmcmc = 1000, burnin = 100, init = NULL, hyper = NULL, tuning = NULL,
        sigma_MH = NULL, npart = NULL, mcmseed = NULL)
```

Arguments

y	single time series of returns
nmcmc	number of iterations for the MCMC procedure
burnin	number of iterations to discard for the MCMC procedure
init	initial values of (phi, sigma, beta) - default is c(0.9, 0.5, .1)
hyper	hyperparameters for bivariate normal distribution of (phi, sigma); user inputs (mu_phi, mu_q, sigma_phi, sigma_q, rho) - default is c(0.9, 0.5, 0.075, 0.3, -0.25)
tuning	tuning parameter - default is .03
sigma_MH	covariance matrix used for random walk Metropolis; it will be scaled by tuning in the script - default is matrix(c(1, -.25, -.25, 1), nrow=2, ncol=2)
npart	number of particles used in particle filter - default is 10
mcmseed	seed for mcmc - default is 90210

Details

The log-volatility process is x_t and the returns are y_t . The SV model is

$$x_t = \phi x_{t-1} + \sigma w_t \quad y_t = \beta \exp\left\{\frac{1}{2}x_t\right\}\epsilon_t$$

where w_t and ϵ_t are independent standard normal white noise.

The model is fit using a technique described in the paper listed below (in the Source section) where the state parameters (ϕ, σ) are sampled simultaneously with a bivariate normal prior specified in the arguments `init` and `hyper`.

Two graphics are returned: (1) the three parameter traces [with effective sample sizes (ESS)], their ACFs, and their histograms with the .025, .5, and .975 quantiles displayed, and (2) the log-volatility posterior mean along with corresponding .95 credible intervals.

Value

Returned invisibly:

phi	vector of sampled state AR parameter
sigma	vector of sampled state error std deviation
beta	vector of sampled observation error scale
log.vol	matrix of sampled log-volatility
options	values of the input arguments

Note

Except for the data, all the other inputs have defaults. The time to run and the acceptance rate are returned at the end of the analysis. The acceptance rate should be around 28% and this can be adjusted using the tuning parameter.

SVfilter

Switching Filter (for Stochastic Volatility Models)

Description

Performs a special case switching filter when the observational noise is a certain mixture of normals. Used to fit a stochastic volatility model.

Usage

```
SVfilter(num, y, phi0, phi1, sQ, alpha, sR0, mu1, sR1)
```

Arguments

num	number of observations
y	time series of returns
phi0	state constant
phi1	state transition parameter
sQ	state standard deviation
alpha	observation constant
sR0	observation error standard deviation for mixture component zero
mu1	observation error mean for mixture component one
sR1	observation error standard deviation for mixture component one

Value

xp	one-step-ahead prediction of the volatility
Pp	mean square prediction error of the volatility
like	the negative of the log likelihood at the given parameter values

Note

See Example 6.23 in Chapter 6 of the text.

test.linear

Test Linearity of a Time Series via Normalized Bispectrum

Description

Produces a plot of the tail probabilities of a normalized bispectrum of a series under the assumption the model is a linear process with iid innovations.

Usage

```
test.linear(series, color = TRUE, detrend = FALSE)
```

Arguments

series	the time series (univariate only)
color	if FALSE, the graphic is produced in gray scale
detrend	if TRUE, the series is detrended first

Value

prob	matrix of tail probabilities - returned invisibly
------	---

Note

The null hypothesis is that the data are from a linear process with i.i.d. innovations. Under the null hypothesis, the bispectrum is constant over all frequencies. Chi-squared test statistics are formed in blocks to measure departures from the null hypothesis and the corresponding p-values are displayed in a graphic and returned invisibly. Details are in Hinich, M. and Wolinsky, M. (2005). Normalizing bispectra. *Journal of Statistical Planning and Inference*, 130, 405–411.

Examples

```
## Not run:
test.linear(nyse) # :(
test.linear(soi)  # :)

## End(Not run)
```

trend	<i>Estimate Trend</i>
-------	-----------------------

Description

Estimates the trend (polynomial or lowess) of a time series and returns a graphic of the series with the trend and error bounds superimposed.

Usage

```
trend(series, order = 1, lowess = FALSE, lowspan = .75, robust = TRUE,
      col = c(4, 6), ylab = NULL, ...)
```

Arguments

series	The time series to be analyzed (univariate only).
order	Order of the polynomial used to estimate the trend with a linear default (order=1) unless lowess is TRUE.
lowess	If TRUE, loess from the stats package is used to fit the trend. The default is FALSE.
lowspan	The smoother span used for lowess.
robust	If TRUE (default), the lowess fit is robust.
col	Vector of two colors for the graphic, first the color of the data (default is blue [4]) and second the color of the trend (default is magenta [6]). Both the data and trend line will be the same color if only one value is given.
ylab	Label for the vertical axis (default is the name of the series).
...	Other graphical parameters.

Details

Produces a graphic of the time series with the trend and a .95 pointwise confidence interval superimposed. The trend estimate and the error bounds are returned invisibly.

Value

Produces a graphic and returns the trend estimate `fit` and error bounds `lwr` and `upr` invisibly (see details) and with the same time series attributes as the input series.

trend(soi)
trend(soi, lowess=TRUE)

## End(Not run)
```

tsplot

Time Series Plot

Description

Produces a nice plot of univariate or multiple time series in one easy line.

Usage

```
tsplot(x, y=NULL, main=NULL, ylab=NULL, xlab='Time', type=NULL,
       margins=.25, ncolm=1, byrow=TRUE, minor=TRUE, nxm=2, nym=1,
       xm.grid=TRUE, ym.grid=TRUE, col=1, gg=FALSE, spaghetti=FALSE,
       pch=NULL, lty=1, lwd=1, mgpp=0, ...)
```

Arguments

x, y	time series to be plotted; if both present, x will be the time index.
main	add a plot title - the default is no title.
ylab	y-axis label - the default is the name of the ts object.
xlab	x-axis label - the default is 'Time'.
type	type of plot - the default is line.
margins	inches to add (or subtract) to the margins. Input one value to apply to all margins or a vector of length 4 to add (or subtract) to the (bottom, left, top, right) margins.
ncolm	for multiple time series, the number of columns to plot.
byrow	for multiple time series - if TRUE (default), plot series row wise; if FALSE, plot series column wise.
minor, nxm, nym	if minor=TRUE, the number of minor tick marks on x-axis, y-axis. minor=FALSE removes both or set either to 0 or 1 to remove. The default is one minor tick on the x-axis and none on the y-axis.
xm.grid, ym.grid	if TRUE (default), adds grid lines at minor x-axis, y-axis ticks.
col	line color(s), can be a vector for multiple time series.
gg	if TRUE, will produce a gris-gris plot (gray graphic interior with white grid lines); the default is FALSE. The grammar of astsa is voodoo; see https://musicaficionado.blog/2017/11/08/gris-gris-by-dr-john/
spaghetti	if TRUE, will produce a spaghetti plot (all series on same plot).
pch	plot symbols (default is 1, circle); can be a vector for multiple plots.
lty	line type (default is 1, solid line); can be a vector for multiple plots.
lwd	line width (default is 1); can be a vector for multiple plots.
mgpp	this is used to adjust (add to) the mgp graphics parameters settings (?par), which are c(1.6, .6, 0) here; the R default is c(3, 1, 0). This will be helpful in moving an axis label farther from the axis if necessary.
...	other graphical parameteres; see par .

Value

Produces a graphic and returns it invisibly so it can be saved in an R variable with the ability to replay it; see [recordPlot](#).

Examples

```
## Not run:

# minimal
tsplot(soi)
# prettified
tsplot(soi, col=4, main="Southern Oscillation Index")

# compare these
par(mfrow=2:1)
tsplot(1:453, soi, ylab='SOI', xlab='Month')
# now recklessly add to the margins and add to mgp to get to the default
tsplot(1:453, soi, ylab='SOI', xlab='Month', margins=c(2,3,4,5), las=1, mgpp=c(1.4,.4,0))

# gris-gris multiple plot
tsplot(climhyd, ncolm=2, gg=TRUE, col=2:7, lwd=2)

# spaghetti (and store it in an object - ?recordPlot for details)
x <- replicate(100, cumsum(rcauchy(1000)))/1:1000)
u <- tsplot(x, col=1:8, main='No LLN For You', spaghetti=TRUE)
u # plot on demand

## End(Not run)
```

unemp

U.S. Unemployment

Description

Monthly U.S. Unemployment series (1948-1978, n = 372)

Usage

```
data(unemp)
```

Format

The format is: Time-Series [1:372] from 1948 to 1979: 235 281 265 241 201 ...

xEM0

EM Algorithm for Time Invariant State Space Models - This script has been superseded by [EM](#).

Description

Estimation of the parameters in a simple state space via the EM algorithm. NOTE: This script has been superseded by [EM](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xEM0(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 50, tol = 0.01)
```

Arguments

num	number of observations
y	observation vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-like decomposition of state error covariance matrix Q – see details below
cR	Cholesky-like decomposition of state error covariance matrix R – see details below
max.iter	maximum number of iterations
tol	relative tolerance for determining convergence

Details

cQ and cR are the Cholesky-type decompositions of Q and R. In particular, $Q = t(cQ) \%*\% cQ$ and $R = t(cR) \%*\% cR$ is all that is required (assuming Q and R are valid covariance matrices).

Value

Phi	Estimate of Phi
Q	Estimate of Q
R	Estimate of R
mu0	Estimate of initial state mean
Sigma0	Estimate of initial state covariance matrix
like	-log likelihood at each iteration
niter	number of iterations to convergence
cvg	relative tolerance at convergence

Note

NOTE: This script has been superseded by [EM](#)

Author(s)

D.S. Stoffer

xEM1	<i>EM Algorithm for General State Space Models - This script has been superseded by EM.</i>
------	---

Description

Estimation of the parameters in the general state space model via the EM algorithm. Inputs are not allowed; see the note. NOTE: This script has been superseded by [EM](#) and scripts starting with an x are scheduled to be phased out.

Usage

```
xEM1(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 100, tol = 0.001)
```

Arguments

num	number of observations
y	observation vector or time series; use 0 for missing values
A	observation matrices, an array with $\text{dim}=c(q, p, n)$; use 0 for missing values
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-like decomposition of state error covariance matrix Q – see details below
cR	R is diagonal here, so $cR = \text{sqrt}(R)$ – also, see details below
max.iter	maximum number of iterations
tol	relative tolerance for determining convergence

Details

cQ and cR are the Cholesky-type decompositions of Q and R. In particular, $Q = t(cQ) \%* \% cQ$ and $R = t(cR) \%* \% cR$ is all that is required (assuming Q and R are valid covariance matrices).

Value

Phi	Estimate of Phi
Q	Estimate of Q
R	Estimate of R
mu0	Estimate of initial state mean
Sigma0	Estimate of initial state covariance matrix
like	-log likelihood at each iteration
niter	number of iterations to convergence
cvg	relative tolerance at convergence

Note

NOTE: This script has been superseded by [EM](#)

xKfilter0

*Kalman Filter - This script has been superseded by [Kfilter](#)***Description**

Returns the filtered values for the basic time invariant state-space model; inputs are not allowed.
 NOTE: This script has been superseded by [Kfilter](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xKfilter0(num, y, A, mu0, Sigma0, Phi, cQ, cR)
```

Arguments

num	number of observations
y	data matrix, vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below

Details

NOTE: This script has been superseded by [Kfilter](#)

Value

xp	one-step-ahead state prediction
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
Kn	last value of the gain, needed for smoothing

Author(s)

D.S. Stoffer

xKfilter1

Kalman Filter - This script has been superseded by [Kfilter](#).

Description

Returns both the predicted and filtered values for a linear state space model. Also evaluates the likelihood at the given parameter values. NOTE: This script has been superseded by [Kfilter](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xKfilter1(num, y, A, mu0, Sigma0, Phi, Ups, Gam, cQ, cR, input)
```

Arguments

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with dim=c(q,p,n)
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed
Gam	observation input matrix; use Gam = 0 if not needed
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

Details

NOTE: This script has been superseded by [Kfilter](#)

Value

xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
Kn	last value of the gain, needed for smoothing

Author(s)

D.S. Stoffer

xKfilter2

Kalman Filter - This script has been superseded by [Kfilter](#).

Description

Returns the filtered values for the state space model. In addition, the script returns the evaluation of the likelihood at the given parameter values and the innovation sequence. NOTE: This script has been superseded by [Kfilter](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xKfilter2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
          S, input)
```

Arguments

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with $\text{dim} = c(q, p, n)$
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed

Gam	observation input matrix; use Gam = 0 if not needed
Theta	state error pre-matrix
cQ	Cholesky decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
S	covariance-type matrix of state and observation errors
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

Details

NOTE: This script has been superseded by [Kfilter](#)

Value

xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
K	last value of the gain, needed for smoothing

xKsmooth0	<i>Kalman Filter and Smoother - This script has been superseded by Ksmooth</i>
-----------	--

Description

Returns both the filtered values and smoothed values for the state-space model. NOTE: This script has been superseded by [Ksmooth](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xKsmooth0(num, y, A, mu0, Sigma0, Phi, cQ, cR)
```

Arguments

num	number of observations
y	data matrix, vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below

Details

NOTE: This script has been superseded by [Ksmooth](#)

Value

xs	state smoothers
Ps	smoother mean square error
x0n	initial mean smoother
P0n	initial smoother covariance
J0	initial value of the J matrix
J	the J matrices
xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
Kn	last value of the gain

xKsmooth2	<i>Kalman Filter and Smoother - This script has been superseded by</i> Ksmooth
-----------	---

Description

Returns the filtered and smoothed values for the state-space model. This is the smoother companion to Kfilter2. NOTE: This script has been superseded by [Ksmooth](#). Note that scripts starting with an x are scheduled to be phased out.

Usage

```
xKsmooth2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
           S, input)
```

Arguments

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with $\text{dim}=c(q,p,n)$
μ_0	initial state mean
Σ_0	initial state covariance matrix
Φ	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed
Gam	observation input matrix; use Gam = 0 if not needed
Theta	state error pre-matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
S	covariance matrix of state and observation errors
