

# Package ‘astsa’

May 7, 2022

**Type** Package

**Title** Applied Statistical Time Series Analysis

**Version** 1.14.4

**Date** 2022-05-07

**Depends** R (>= 3.5)

**Author** David Stoffer [aut, cre], Nicky Poison [ctb, mus, spy]

**Maintainer** David Stoffer <stoffer@pitt.edu>

**BugReports** <https://github.com/nickpoison/astsa/issues>

**Description** Data sets and scripts to accompany Time Series Analysis and Its Applications: With R Examples (4th ed), by R.H. Shumway and D.S. Stoffer. Springer Texts in Statistics, 2017, <DOI:10.1007/978-3-319-52452-8>, and Time Series: A Data Analysis Approach Using R. Chapman-Hall, 2019, <DOI:10.1201/9780429273285>.

**URL** <https://github.com/nickpoison/astsa/>,  
<https://www.stat.pitt.edu/stoffer/tsa4/>,  
<https://www.stat.pitt.edu/stoffer/tsda/>

**License** GPL-3

**LazyLoad** yes

**LazyData** yes

## Description

Includes data and scripts to accompany [Time Series Analysis and Its Applications: With R Examples \(4th ed, 2017\)](#) and [Time Series: A Data Analysis Approach Using R, \(1st ed, 2019\)](#).

## Details

Package: astsa  
 Type: Package  
 Version: 1.14.4  
 Date: 2022-05-07  
 License: GPL-3  
 LazyLoad: yes  
 LazyData: yes

## Author(s)

David Stoffer <stoffer@pitt.edu>

## References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

---

acf1

*Plot and print ACF or PACF of a time series*

---

## Description

Produces a plot (and a printout) of the sample ACF or PACF. The zero lag value of the ACF is removed.

## Usage

```
acf1(series, max.lag=NULL, plot=TRUE, main=NULL, ylim=NULL, pacf=FALSE,
      ylab=NULL, na.action = na.pass, ...)
```

## Arguments

series	The data. Does not have to be a time series object.
max.lag	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$ . If the series is seasonal, this will be at least 4 seasons by default.
plot	If TRUE (default), a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script.
main	Title of graphic; defaults to name of series.
ylim	Specify limits for the y-axis.

pacf	If TRUE, the sample PACF is returned instead of ACF.
ylab	Change y-axis label from default.
na.action	How to handle missing data; default is na.pass
...	Additional arguments passed to <a href="#">tsplot</a>

### Details

Will plot and print the sample ACF or PACF (if pacf=TRUE). The zero lag of the ACF (which is always 1) has been removed. If plot=TRUE, a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script. The error bounds are approximate white noise bounds,  $-1/n \pm 2/\sqrt{n}$ ; no other option is given.

### Value

ACF	The sample ACF or PACF
-----	------------------------

### Author(s)

D.S. Stoffer

### References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

### Examples

```
acf1(rnorm(100))

acf1(sarima.sim(ar=.9), pacf=TRUE)

# show it to your mom:
acf1(soi, col=6, lwd=4, gg=TRUE)
```

---

acf2

*Plot and print ACF and PACF of a time series*

---

### Description

Produces a simultaneous plot (and a printout) of the sample ACF and PACF on the same scale. The zero lag value of the ACF is removed.

### Usage

```
acf2(series, max.lag=NULL, plot=TRUE, main=NULL, ylim=NULL,
      na.action = na.pass, ...)
```

## Arguments

<code>series</code>	The data. Does not have to be a time series object.
<code>max.lag</code>	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$ . If the series is seasonal, this will be at least 4 seasons by default.
<code>plot</code>	If TRUE (default), a graph is produced and the values are rounded and listed. If FALSE, no graph is produced and the values are listed but not rounded by the script.
<code>main</code>	Title of graphic; defaults to name of series.
<code>ylim</code>	Specify limits for the y-axis.
<code>na.action</code>	How to handle missing data; default is <code>na.pass</code>
<code>...</code>	Additional arguments passed to <a href="#">tsplot</a>

## Details

This is basically a wrapper for `acf()` provided in `tseries`. The error bounds are approximate white noise bounds,  $-1/n \pm 2/\sqrt{n}$ ; no other option is given.

## Value

ACF	The sample ACF
PACF	The sample PACF

## Author(s)

D.S. Stoffer

## References

You can find demonstrations of `astsa` capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

## Examples

```
acf2(rnorm(100))

acf2(rnorm(100), 25, main='') # no title

acf2(rnorm(100), plot=FALSE), 'ACF' # print only ACF

acf2(soi, col=2:7, lwd=4, gg=TRUE) # mother's day present
```

acfm

*ACF and CCF for Multiple Time Series***Description**

Produces a grid of plots of the sample ACF (diagonal) and CCF (off-diagonal).

**Usage**

```
acfm(series, max.lag = NULL, na.action = na.pass, ylim = NULL,
      acf.highlight = TRUE, ...)
```

**Arguments**

series	Multiple time series (at least 2 columns of time series)
max.lag	Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$ . If the series is seasonal, this will be at least 4 seasons by default.
na.action	How to handle missing data; default is na.pass
ylim	Specify limits for the all correlation axes. If NULL (default) the values are a little wider than the min and max of all values.
acf.highlight	If TRUE (default), the diagonals (ACFs) are highlighted.
...	Additional arguments passed to <a href="#">tsplot</a>

**Details**

Produces a grid of plots of the sample ACF (diagonal) and CCF (off-diagonal). The plots in the grid are estimates of  $\text{corr}\{x(t+\text{LAG}), y(t)\}$ . Thus  $x$  leads  $y$  if LAG is positive and  $x$  lags  $y$  if LAG is negative.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

**Examples**

```
acfm(diff(log(econ5)))
```

```
acfm(diff(log(econ5)), gg=TRUE, acf=FALSE)
```

---

ar1miss

*AR with Missing Values*

---

### Description

Data used in Chapter 6

### Format

The format is: Time-Series [1:100] with NA for missing values.

### References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

---

arf

*Simulated ARFIMA*

---

### Description

1000 simulated observations from an ARFIMA(1, 1, 0) model with  $\phi = .75$  and  $d = .4$ .

### Format

The format is: Time-Series [1:1000] from 1 to 1000: -0.0294 0.7487 -0.3386 -1.0332 -0.2627 ...

### References

arma.spec

*Spectral Density of an ARMA Model***Description**

Gives the ARMA spectrum, tests for causality, invertibility, and common zeros.

**Usage**

```
arma.spec(ar = 0, ma = 0, var.noise = 1, n.freq = 500,
          main='from specified model', frequency=1, ylim=NULL, ...)
```

**Arguments**

ar	vector of AR parameters
ma	vector of MA parameters
var.noise	variance of the noise
n.freq	number of frequencies
main	title of graphic
frequency	for seasonal models, adjusts the frequency scale
ylim	optional; specify limits for the y-axis
...	additional arguments

**Details**

The basic call is `arma.spec(ar,ma)` where `ar` and `ma` are vectors containing the model parameters. Use `log='y'` if you want the plot on a log scale. If the model is not causal or invertible an error message is given. If there are approximate common zeros, a spectrum will be displayed and a warning will be given; e.g., `arma.spec(ar=.9,ma=-.9)` will yield a warning and the plot will be the spectrum of white noise.

**Value**

freq	frequencies - returned invisibly
spec	spectral ordinates - returned invisibly

**Author(s)**

D.S. Stoffer

**References**

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

**Examples**

```
arma.spec(ar = c(1, -.9), ma = .8)

arma.spec(ar = c(1, -.9), log='y')

arma.spec(ar = c(1, -.9), main='AR(2)', gg=TRUE, col=5, lwd=2)

arma.spec(ar=c(rep(0,11),.4), ma=.5, col=5, lwd=3, frequency=12)
```

ARMAtoAR

*Convert ARMA Process to Infinite AR Process***Description**

Gives the  $\pi$ -weights in the invertible representation of an ARMA model.

**Usage**

```
ARMAtoAR(ar = 0, ma = 0, lag.max=20)
```

**Arguments**

ar	vector of AR coefficients
ma	vector of MA coefficients
lag.max	number of pi-weights desired

**Value**

A vector of coefficients.

**Examples**

```
ARMAtoAR(ar=.9, ma=.5, 10)
```

---

astsa.col

*astsa color palette with transparency*

---

## Description

Modifies the opacity level of the astsa color palette.

## Usage

```
astsa.col(col = 1, alpha = 1)
```

## Arguments

col	numerical vector representing colors (default is 1 or 'black') - see Examples
alpha	factor in [0,1] setting the opacity (default is 1)

## Value

a color vector using the astsa color palette at the chosen transparency level

## Note

The astsa color palette is attached when the package is attached. The colors follow the R pattern of shades of: (1) black, (2) red, (3) green, (4) blue, (5) cyan, (6) magenta, (7) gold, (8) gray. The opacity of these colors can be changed easily using this script. Values are recycled, e.g., col=9 is the same as col=1.

The astsa palette was developed from two basic ideas. The first is the general idea that time series should be plotted using dark colors. The second is personal in that we prefer to anchor plots with the best blue, dodgerblue3. From there, we used the website <https://www.color-hex.com/> to pick colors of type 2 to 7 that complement dodgerblue3.

## Author(s)

D.S.Stoffer

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

## Examples

```
# View the astsa palette
par(mfrow=c(3,1))
barplot(rep(1,8), col=1:8, main='astsa palette', names=1:8)
barplot(rep(1,8), col=astsa.col(1:8, .7), main='transparency', names=1:8)
barplot(rep(1,8), col=astsa.col(3:6, .5), main='pastelity', names=rep(3:6, 2))

# plotting 2 series that touch (but in a nice way)
tsplot(cbind(gtemp_land, gtemp_ocean), col=astsa.col(c(4,2), .5), lwd=2, spaghetti=TRUE,
        type='o', pch=20, ylab="Temperature Deviations")
legend('topleft', legend=c("Land Only", "Ocean Only"), col=c(4,2), lwd=2, pch=20, bty='n')
```

---

beamd

*Infrasonic Signal from a Nuclear Explosion*

---

## Description

Infrasonic signal from a nuclear explosion.

## Usage

```
data(beamd)
```

## Format

A data frame with 2048 observations (rows) on 3 numeric variables (columns): sensor1, sensor2, sensor3.

## Details

This is a data frame consisting of three columns (that are not time series objects). The data are an infrasonic signal from a nuclear explosion observed at sensors on a triangular array.

birth

*U.S. Monthly Live Births***Description**

Monthly live births (adjusted) in thousands for the United States, 1948-1979.

**Format**

The format is: Time-Series [1:373] from 1948 to 1979: 295 286 300 278 272 268 308 321 313 308 ...

blood

*Daily Blood Work***Description**

Multiple time series of measurements made for 91 days on the three variables, log(white blood count) [WBC], log(platelet) [PLT] and hematocrit [HCT]. Missing data code is NA.

**Format**

The format is: mts [1:91, 1:3]

**Details**

This is the data set used in Chapter 6 with NA as the missing data code.

```

---

bnrf1ebv

*Nucleotide sequence - BNRF1 Epstein-Barr*

---

**Description**

Nucleotide sequence of the BNRF1 gene of the Epstein-Barr virus (EBV): 1=A, 2=C, 3=G, 4=T. The data are used in Chapter 7.

**Format**

The format is: Time-Series [1:3954] from 1 to 3954: 1 4 3 3 1 1 3 1 3 1 ...

---

`cardox`*Monthly Carbon Dioxide Levels at Mauna Loa*

---

**Description**

Monthly mean carbon dioxide (in ppm) measured at Mauna Loa Observatory, Hawaii. This is an update to `co2` in the `datasets` package.

**Format**

The format is: Time-Series [1:729] from March, 1958 to November 2018: 315.71 317.45 317.50 317.10 ...

**Details**

The carbon dioxide data measured as the mole fraction in dry air, on Mauna Loa constitute the longest record of direct measurements of CO<sub>2</sub> in the atmosphere. They were started by C. David Keeling of the Scripps Institution of Oceanography in March of 1958 at a facility of the National Oceanic and Atmospheric Administration. NOAA started its own CO<sub>2</sub> measurements in May of 1974, and they have run in parallel with those made by Scripps since then. Data are reported as a dry mole fraction defined as the number of molecules of carbon dioxide divided by the number of molecules of dry air multiplied by one million (ppm).

---

`ccf2`*Cross Correlation*

---

**Description**

Produces a nice graphic of the sample CCF of two time series. The actual CCF values are returned invisibly.

**Usage**

```
ccf2(x, y, max.lag = NULL, main = NULL, ylab = "CCF", plot = TRUE,  
      na.action = na.pass, type = c("correlation", "covariance"), ...)
```

**Arguments**

<code>x, y</code>	univariate time series
<code>max.lag</code>	maximum lag for which to calculate the CCF
<code>main</code>	plot title - if NULL, uses x and y names
<code>ylab</code>	vertical axis label; default is 'CCF'
<code>plot</code>	if TRUE (default) a graphic is produced and the values are returned invisibly. Otherwise, the values are returned.
<code>na.action</code>	how to handle missing values; default is <code>na.pass</code>
<code>type</code>	default is cross-correlation; an option is cross-covariance
<code>...</code>	additional arguments passed to <code>tsplot</code>

**Details**

This will produce a graphic of the sample  $\text{corr}[x(t+\text{lag}), y(t)]$  from `-max.lag` to `max.lag`. Also, the (rounded) values of the CCF are returned invisibly unless `plot=FALSE`. Similar details apply to the cross-covariance.

climhyd

*Lake Shasta inflow data*

---

**Description**

Lake Shasta inflow data. This is a data frame.

**Format**

A data frame with 454 observations (rows) on the following 6 numeric variables (columns): Temp, DewPt, CldCvr, WndSpd, Precip, Inflow.

**Details**

The data are 454 months of measured values for the climatic variables: air temperature, dew point, cloud cover, wind speed, precipitation, and inflow, at Lake Shasta, California. The man-made lake is famous for the placard stating, "We don't swim in your toilet, so don't pee in our lake."

detrend	<i>Detrend a Time Series</i>
---------	------------------------------

---

**Description**

Returns a time series with the trend removed. The trend can be estimated using polynomial regression or using a lowess fit.

**Usage**

```
detrend(series, order = 1, lowess = FALSE, lowspan = 2/3)
```

**Arguments**

series	The time series to be detrended.
order	Order of the polynomial used to estimate the trend with a linear default (order=1) unless lowess is TRUE.
lowess	If TRUE, lowess is used to find the trend. The default is FALSE.
lowspan	The smoother span used for lowess.

**Value**

The detrended series is returned.

**Author(s)**

D.S. Stoffer

---

dna2vector	<i>Convert DNA Sequence to Indicator Vectors</i>
------------	--

---

### Description

Takes a DNA sequence (string) of general form (e.g., FASTA) and converts it to a sequence of indicator vectors for use with the Spectral Envelope (specenv).

### Usage

```
dna2vector(data, alphabet = NULL)
```

### Arguments

data	A DNA sequence as a single string.
alphabet	The particular alphabet being used. The default is <code>alphabet=c("A", "C", "G", "T")</code> .

## Details

Takes a string of categories and converts it to a matrix of indicators. The data can then be used by the script [specenv](#), which calculates the Spectral Envelope of the sequence (or subsequence). Many different type of sequences can be used, including FASTA and GenBank, as long as the data is a string of categories.

The indicator vectors (as a matrix) are returned invisibly in case the user forgets to put the results in an object wherein the screen would scroll displaying the entire sequence. In other words, the user should do something like `xdata = dna2vector(data)` where `data` is the original sequence.

As an example, if the DNA sequence is in a FASTA file, say `sequence.fasta`, remove the first line which will look like `>V01555.2 . . . .`. Then the following code can be used to read the data into the session, create the indicator sequence and save it as a compressed R data file:

```
fileName <- 'sequence.fasta'      # name of FASTA file
data      <- readChar(fileName, file.info(fileName)$size) # input the sequence
myseq     <- dna2vector(data)      # convert it to indicators

##== and if you want to compress and save the data ==##
save(myseq, file='myseq.rda')
##== and then load it when needed ==##
load('myseq.rda')
```

## Value

matrix of indicator vectors; returned invisibly

## Author(s)

D.S. Stoffer

---

EM0

*EM Algorithm for Time Invariant State Space Models*

---

### Description

Estimation of the parameters in a simple state space via the EM algorithm.

### Usage

```
EM0(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 50, tol = 0.01)
```

**Arguments**

num	number of observations
y	observation vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-like decomposition of state error covariance matrix Q – see details below
cR	Cholesky-like decomposition of state error covariance matrix R – see details below
max.iter	maximum number of iterations
tol	relative tolerance for determining convergence

**Details**

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

Phi	Estimate of Phi
Q	Estimate of Q
R	Estimate of R
mu0	Estimate of initial state mean
Sigma0	Estimate of initial state covariance matrix
like	-log likelihood at each iteration
niter	number of iterations to convergence
cvg	relative tolerance at convergence

**Author(s)**

D.S. Stoffer

**References**

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

EM1

*EM Algorithm for General State Space Models***Description**

Estimation of the parameters in the general state space model via the EM algorithm. Inputs are not allowed; see the note.

**Usage**

```
EM1(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 100, tol = 0.001)
```

**Arguments**

num	number of observations
y	observation vector or time series; use 0 for missing values
A	observation matrices, an array with $\text{dim} = c(q, p, n)$ ; use 0 for missing values
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-like decomposition of state error covariance matrix $Q$ – see details below
cR	$R$ is diagonal here, so $cR = \text{sqrt}(R)$ – also, see details below
max.iter	maximum number of iterations
tol	relative tolerance for determining convergence

**Details**

$cQ$  and  $cR$  are the Cholesky-type decompositions of  $Q$  and  $R$ . In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming  $Q$  and  $R$  are valid covariance matrices).

**Value**

Phi	Estimate of $\Phi$
Q	Estimate of $Q$
R	Estimate of $R$
mu0	Estimate of initial state mean
Sigma0	Estimate of initial state covariance matrix
like	-log likelihood at each iteration
niter	number of iterations to convergence
cvg	relative tolerance at convergence

**Note**

Inputs are not allowed (and hence not estimated). The script uses `Ksmooth1` and everything related to inputs are set equal to zero when it is called.

It would be relatively easy to include estimates of 'Ups' and 'Gam' because conditional on the states, these are just regression coefficients. If you decide to alter EM1 to include estimates of the 'Ups' or 'Gam', feel free to notify me with a workable example and I'll include it in the next update.

fmri

*fmri - complete data set*

## Description

Data (as a vector list) from an fMRI experiment in pain, listed by location and stimulus. The data are BOLD signals when a stimulus was applied for 32 seconds and then stopped for 32 seconds. The signal period is 64 seconds and the sampling rate was one observation every 2 seconds for 256 seconds ( $n = 128$ ). The number of subjects under each condition varies.

## Details

The LOCATIONS of the brain where the signal was measured were [1] Cortex 1: Primary Somatosensory, Contralateral, [2] Cortex 2: Primary Somatosensory, Ipsilateral, [3] Cortex 3: Secondary Somatosensory, Contralateral, [4] Cortex 4: Secondary Somatosensory, Ipsilateral, [5] Caudate, [6] Thalamus 1: Contralateral, [7] Thalamus 2: Ipsilateral, [8] Cerebellum 1: Contralateral and [9] Cerebellum 2: Ipsilateral.

The TREATMENTS or stimuli (and number of subjects in each condition) are [1] Awake-Brush (5 subjects), [2] Awake-Heat (4 subjects), [3] Awake-Shock (5 subjects), [4] Low-Brush (3 subjects), [5] Low-Heat (5 subjects), and [6] Low-Shock (4 subjects). Issue the command `summary(fmri)` for further details. In particular, awake (Awake) or mildly anesthetized (Low) subjects were subjected levels of periodic brushing (Brush), application of heat (Heat), and mild shock (Shock) effects.

As an example, `fmri$L1T6` (Location 1, Treatment 6) will show the data for the four subjects receiving the Low-Shock treatment at the Cortex 1 location; note that `fmri[[6]]` will display the same data.

globtemp

*Global mean land-ocean temperature deviations to 2015***Description**

Global mean land-ocean temperature deviations (from 1951-1980 average), measured in degrees centigrade, for the years 1880-2015. This was an update of gtemp, but gtemp\_land and gtemp\_ocean are the most recent updates.

**Format**

The format is: Time-Series [1:136] from 1880 to 2015: -0.2 -0.11 -0.1 -0.2 -0.28 -0.31 -0.3 -0.33 -0.2 -0.11 ...

**Details**

The data were changed after 2011, so there are discrepancies between this data set and gtemp. The differences are explained in the following document: [www1.ncdc.noaa.gov/pub/data/ghcn/v3/GHCNM-v3.2.0-FAQ.pdf](http://www1.ncdc.noaa.gov/pub/data/ghcn/v3/GHCNM-v3.2.0-FAQ.pdf).

**Source**

globtempl

*Global mean land (only) temperature deviations to 2015***Description**

Global mean [land only] temperature deviations (from 1951-1980 average), measured in degrees centigrade, for the years 1880-2015. This is an update of gtemp2. Note the data file is globtemp-el not globtemp-one; the el stands for land. The data files gtemp\_land and gtemp\_ocean are the most recent updates.

**Usage**

```
data("globtempl")
```

**Format**

The format is: Time-Series [1:136] from 1880 to 2015: -0.53 -0.51 -0.41 -0.43 -0.72 -0.56 -0.7 -0.74 -0.53 -0.25 ...

**Details**

The data were changed after 2011, so there are discrepancies between this data set and gtemp2. The differences are explained in the following document:  
[www1.ncdc.noaa.gov/pub/data/ghcn/v3/GHCNM-v3.2.0-FAQ.pdf](http://www1.ncdc.noaa.gov/pub/data/ghcn/v3/GHCNM-v3.2.0-FAQ.pdf).

Grid

*A Better Add Grid to a Plot***Description**

Adds a grid to an existing plot with major and minor ticks. Works like R graphics `grid()` but the grid lines are solid and gray and minor ticks are produced by default.

**Usage**

```
Grid(nx = NULL, ny = nx, col = gray(0.9), lty = 1, lwd = par("lwd"), equilogs = TRUE,
     minor = TRUE, nxm = 2, nym = 2, tick.ratio = 0.5, xm.grid = TRUE, ym.grid = TRUE, ...)
```

**Arguments**

<code>nx, ny</code>	number of cells of the grid in x and y direction. When NULL, as per default, the grid aligns with the tick marks on the corresponding default axis (i.e., tickmarks as computed by <code>axTicks</code> ). When NA, no grid lines are drawn in the corresponding direction.
<code>col</code>	color of the grid lines.
<code>lty</code>	line type of the grid lines.
<code>lwd</code>	line width of the grid lines.
<code>equilogs</code>	logical, only used when log coordinates and alignment with the axis tick marks are active. Setting <code>equilogs = FALSE</code> in that case gives non equidistant tick aligned grid lines.
<code>minor</code>	logical with TRUE (default) adding minor ticks.
<code>nxm, nym</code>	number of intervals in which to divide the area between major tick marks on the x-axis (y-axis). If <code>minor=TRUE</code> , should be > 1 or no minor ticks will be drawn.
<code>tick.ratio</code>	ratio of lengths of minor tick marks to major tick marks. The length of major tick marks is retrieved from <code>par("tck")</code> .
<code>xm.grid, ym.grid</code>	if TRUE (default), adds grid lines at minor x-axis, y-axis ticks.
<code>...</code>	other graphical parameters;

**Author(s)**

D.S. Stoffer

**Source**

The code for `grid()` in R graphics and `minor.tick()` from the Hmisc package were combined.

Hare	<i>Snowshoe Hare</i>
------	----------------------

---

### Description

This is one of the classic studies of predator-prey interactions, the 90-year data set is the number, in thousands, of snowshoe hare pelts purchased by the Hudson's Bay Company of Canada. While this is an indirect measure of predation, the assumption is that there is a direct relationship between the number of pelts collected and the number of hare and lynx in the wild.

### Usage

```
data("Hare")
```

### Format

The format is: Time-Series [1:91] from 1845 to 1935: 19.6 19.6 19.6 12 28 ...

### Note

This data set pairs with [Lynx](#). The data are in units of one thousand.

### Source

From Odum's "Fundamentals of Ecology", p. 191. Data listed at:  
`people.whitman.edu/~hundredr/courses/M250F03/LynxHare.txt`.

Kfilter0

*Kalman Filter - Time Invariant Model***Description**

Returns the filtered values for the basic time invariant state-space model; inputs are not allowed.

**Usage**

```
Kfilter0(num, y, A, mu0, Sigma0, Phi, cQ, cR)
```

**Arguments**

num	number of observations
y	data matrix, vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below

**Details**

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

xp	one-step-ahead state prediction
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
Kn	last value of the gain, needed for smoothing

**Author(s)**

D.S. Stoffer

---

Kfilter1	<i>Kalman Filter - Model may be time varying or have inputs</i>
----------	---

---

## Description

Returns both the predicted and filtered values for a linear state space model. Also evaluates the likelihood at the given parameter values.

## Usage

```
Kfilter1(num, y, A, mu0, Sigma0, Phi, Ups, Gam, cQ, cR, input)
```

## Arguments

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with $\text{dim}=c(q,p,n)$
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed
Gam	observation input matrix; use Gam = 0 if not needed
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

## Details

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
Kn	last value of the gain, needed for smoothing

---

Kfilter2

---

*Kalman Filter - Model may be time varying or have inputs or correlated errors*

---

**Description**

Returns the filtered values for the state space model. In addition, the script returns the evaluation of the likelihood at the given parameter values and the innovation sequence.

**Usage**

```
Kfilter2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
          S, input)
```

**Arguments**

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with dim = c(q,p,n)
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed

Gam	observation input matrix; use Gam = 0 if not needed
Theta	state error pre-matrix
cQ	Cholesky decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
S	covariance-type matrix of state and observation errors
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

### Details

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

### Value

xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
innov	innovation series
sig	innovation covariances
K	last value of the gain, needed for smoothing

Ksmooth0

*Kalman Filter and Smoother - Time invariant model without inputs***Description**

Returns both the filtered values and smoothed values for the state-space model.

**Usage**

```
Ksmooth0(num, y, A, mu0, Sigma0, Phi, cQ, cR)
```

**Arguments**

num	number of observations
y	data matrix, vector or time series
A	time-invariant observation matrix
mu0	initial state mean vector
Sigma0	initial state covariance matrix
Phi	state transition matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below

**Details**

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

xs	state smoothers
Ps	smoother mean square error
x0n	initial mean smoother
P0n	initial smoother covariance
J0	initial value of the J matrix
J	the J matrices
xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
Kn	last value of the gain

Ksmooth1	<i>Kalman Filter and Smoother - General model</i>
----------	---

---

## Description

Returns both the filtered and the smoothed values for the state-space model.

## Usage

```
Ksmooth1(num, y, A, mu0, Sigma0, Phi, Ups, Gam, cQ, cR, input)
```

## Arguments

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with $\text{dim}=c(q,p,n)$
mu0	initial state mean
Sigma0	initial state covariance matrix
Phi	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed
Gam	observation input matrix; use Gam = 0 if not needed
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

## Details

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

$x_s$	state smoothers
$P_s$	smoother mean square error
$x_0$	initial mean smoother
$P_0$	initial smoother covariance
$J_0$	initial value of the J matrix
$J$	the J matrices
$x_p$	one-step-ahead prediction of the state
$P_p$	mean square prediction error
$x_f$	filter value of the state
$P_f$	mean square filter error
$like$	the negative of the log likelihood
$K_n$	last value of the gain

---

Ksmooth2

---

*Kalman Filter and Smoother - General model, may have correlated errors*

---

**Description**

Returns the filtered and smoothed values for the state-space model. This is the smoother companion to Kfilter2.

**Usage**

```
Ksmooth2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
          S, input)
```

**Arguments**

num	number of observations
y	data matrix, vector or time series
A	time-varying observation matrix, an array with $\text{dim}=c(q,p,n)$
$\mu_0$	initial state mean
$\Sigma_0$	initial state covariance matrix
$\Phi$	state transition matrix
Ups	state input matrix; use Ups = 0 if not needed
Gam	observation input matrix; use Gam = 0 if not needed
Theta	state error pre-matrix
cQ	Cholesky-type decomposition of state error covariance matrix Q – see details below
cR	Cholesky-type decomposition of observation error covariance matrix R – see details below
S	covariance matrix of state and observation errors
input	matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed

**Details**

cQ and cR are the Cholesky-type decompositions of Q and R. In particular,  $Q = t(cQ) \% \% cQ$  and  $R = t(cR) \% \% cR$  is all that is required (assuming Q and R are valid covariance matrices).

**Value**

xs	state smoothers
Ps	smoother mean square error
J	the J matrices
xp	one-step-ahead prediction of the state
Pp	mean square prediction error
xf	filter value of the state
Pf	mean square filter error
like	the negative of the log likelihood
Kn	last value of the gain

lag1.plot

*Lag Plot - one time series***Description**

Produces a grid of scatterplots of a series versus lagged values of the series.

**Usage**

```
lag1.plot(series, max.lag=1, corr=TRUE, smooth=TRUE, col=gray(.1),
          lwl=1, bgl='white', box.col=8, ...)
```

**Arguments**

series	the data
max.lag	maximum lag
corr	if TRUE, shows the autocorrelation value in a legend
smooth	if TRUE, adds a lowess fit to each scatterplot
col	color of points; default is gray(.1)
lwl	width of lowess line; default is 1
bgl	background of the ACF legend; default is 'white'
box.col	color of the border of the ACF legend; default is 'gray(62)'
...	additional graphical arguments

[lag2.plot](#)

**Examples**

```
lag1.plot(log(varve), max.lag=9)
lag1.plot(soi, 12, cex=1, pch=19, col=astsa.col(4, .3), gg=TRUE, corr=FALSE)
```

lag2.plot

*Lag Plot - two time series***Description**

Produces a grid of scatterplots of one series versus another. The first named series is the one that gets lagged.

**Usage**

```
lag2.plot(series1, series2, max.lag = 0, corr = TRUE, smooth = TRUE, col = gray(.1),
          lwl=1, bgl = 'white', box.col=8, ...)
```

**Arguments**

series1	first series (the one that gets lagged)
series2	second series
max.lag	maximum number of lags
corr	if TRUE, shows the cross-correlation value in a legend
smooth	if TRUE, adds a lowess fit to each scatterplot
col	color of points; default is gray(.1)
lwl	width of lowess line; default is 1
bgl	background of the ACF legend; default is 'white'
box.col	color of the border of the ACF legend; default is 'gray(62)'
...	additional graphical parameters

lag2.plot(soi, rec, 8, cex=1.1, pch=19, col=5, bgl='transparent', lwl=2)
```

LagReg

*Lagged Regression***Description**

Performs lagged regression as discussed in Chapter 4.

**Usage**

```
LagReg(input, output, L = c(3, 3), M = 40, threshold = 0,
       inverse = FALSE)
```

**Arguments**

input	input series
output	output series
L	degree of smoothing; see spans in the help file for spec.pgram.
M	must be even; number of terms used in the lagged regression
threshold	the cut-off used to set small (in absolute value) regression coefficients equal to zero
inverse	if TRUE, will fit a forward-lagged regression

**Details**

For a bivariate series, input is the input series and output is the output series. The degree of smoothing for the spectral estimate is given by L; see spans in the help file for spec.pgram. The number of terms used in the lagged regression approximation is given by M, which must be even. The threshold value is the cut-off used to set small (in absolute value) regression coefficients equal to zero (it is easiest to run LagReg twice, once with the default threshold of zero, and then again after inspecting the resulting coefficients and the corresponding values of the CCF). Setting inverse=TRUE will fit a forward-lagged regression; the default is to run a backward-lagged regression. The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

**Value**

Graphs of the estimated impulse response function, the CCF, and the output with the predicted values superimposed.

beta	Estimated coefficients
fit	The output series, the fitted values, and the residuals

**Author(s)**

D.S. Stoffer

lap

*LA Pollution-Mortality Study*

---

## Description

LA Pollution-Mortality Study (1970-1979, weekly data).

## Format

The format is: `mts [1:508, 1:11]`

## Details

columns are time series	with names
(1) Total Mortality	<code>tmort</code>
(2) Respiratory Mortality	<code>rmort</code>
(3) Cardiovascular Mortality	<code>cmort</code>
(4) Temperature	<code>tempr</code>
(5) Relative Humidity	<code>rh</code>
(6) Carbon Monoxide	<code>co</code>
(7) Sulfur Dioxide	<code>so2</code>
(8) Nitrogen Dioxide	<code>no2</code>
(9) Hydrocarbons	<code>hycarb</code>
(10) Ozone	<code>o3</code>
(11) Particulates	<code>part</code>

## Note

Details may be found in <http://www.sungpark.net/ShumwayAzariPawitan88.pdf>

lead

*Leading Indicator***Description**

Leading indicator, 150 months; taken from Box and Jenkins (1970).

**Usage**

```
data(lead)
```

**Format**

The format is: Time-Series [1:150] from 1 to 150: 10.01 10.07 10.32 9.75 10.33 ...

**Details**

This is also the R time series `BJsales.lead`: The sales time series `BJsales` and leading indicator `BJsales.lead` each contain 150 observations. The objects are of class "ts".

Lynx

*Canadian Lynx***Description**

This is one of the classic studies of predator-prey interactions, the 90-year data set is the number, in thousands, of lynx pelts purchased by the Hudson's Bay Company of Canada. While this is an indirect measure of predation, the assumption is that there is a direct relationship between the number of pelts collected and the number of hare and lynx in the wild.

**Usage**

```
data("Lynx")
```

**Format**

The format is: Time-Series [1:91] from 1845 to 1935: 30.1 45.1 49.1 39.5 21.2 ...

**Note**

The data are in units of one thousand. This data set pairs with [Hare](#) and is NOT the same as [lynx](#).

matrixpwr

*Powers of a Square Matrix*

---

**Description**

matrixpwr computes powers of a square matrix, including negative powers for nonsingular matrices.

%^% is a more intuitive interface as an operator.

**Usage**

```
matrixpwr(A, power)
```

```
A %^% power
```

**Arguments**

A	a square matrix
power	single numeric

**Details**

Raises matrix to the specified power. The matrix must be square and if power < 0, the matrix must be nonsingular.

Note that %^% is defined as "%^%" <-function(A,power) matrixpwr(A,power)

If power = 0, the identity matrix is returned.

**Value**

Returns matrix raised to the given power.

**Author(s)**

D.S. Stoffer

**References**

**Examples**

```
# 2-state Markov transition matrix to steady state
P = matrix(c(.7,.4,.3,.6), 2)
P %^^ 50

# surround with parentheses if used in an expression
c(.5,.5) %*% (P%^^50)

# Inverse square root
Q = var(econ5)
Q %^^ -.5
```

---

mvspec

*Univariate and Multivariate Spectral Estimation*

---

**Description**

This is spec.pgram with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as fxx. The bandwidth calculation has been changed to the more practical definition given in the text and this can be used to replace spec.pgram.

**Usage**

```
mvspec(x, spans = NULL, kernel = NULL, taper = 0, pad = 0,
       fast = TRUE, demean = FALSE, detrend = TRUE,
       plot = TRUE, log='n', type = NULL, na.action = na.fail,
       nxm=2, nym=1, main=NULL, ...)
```

## Arguments

x	univariate or multivariate time series (i.e., the p columns of x are time series)
spans	specify smoothing; same as spec.pgram
kernel	specify kernel; same as spec.pgram
taper	specify taper; same as spec.pgram with different default
pad	specify padding; same as spec.pgram
fast	specify use of FFT; same as spec.pgram
demean	if TRUE, series is demeaned first; same as spec.pgram
detrend	if TRUE, series is detrended first; same as spec.pgram
plot	plot the estimate; same as spec.pgram
log	same as spec.pgram but default is 'no'
type	type of plot to be drawn, defaults to lines
na.action	same as spec.pgram
nxm, nym	the number of minor tick mark divisions on x-axis, y-axis; the default is one minor tick on the x-axis and none on the y-axis
main	title of the graphics; if NULL, a suitable title is generated
...	graphical arguments passed to plot.spec

## Details

This is spec.pgram from the stats package with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as fxx. The default for the plot is NOT to plot on a log scale and the graphic will have a grid. The bandwidth calculation has been changed to the more practical definition given in the text,  $(L_h/n.used) * frequency(x)$ . Also, the bandwidth is no longer displayed in the graphic. Although meant to be used to easily obtain multivariate spectral estimates, this script can be used for univariate time series. Note that the script does not taper by default (taper=0); this forces the user to do "conscious tapering".

## Value

An object of class "spec", which is a list containing at least the following components:

fxx	spectral matrix estimates; an array of dimensions $\text{dim} = c(p, p, \text{nfreq})$
freq	vector of frequencies at which the spectral density is estimated.
spec	vector (for univariate series) or matrix (for multivariate series) of estimates of the spectral density at frequencies corresponding to freq.
details	matrix with columns: frequency, period, spectral ordinate(s)
coh	NULL for univariate series. For multivariate time series, a matrix containing the squared coherency between different series. Column $i + (j - 1) * (j - 2)/2$ of coh contains the squared coherency between columns i and j of x, where $i < j$ .
phase	NULL for univariate series. For multivariate time series a matrix containing the cross-spectrum phase between different series. The format is the same as coh.
Lh	Number of frequencies (approximate) used in the band.
n.used	Sample length used for the FFT
df	Degrees of freedom (may be approximate) associated with the spectral estimate.
bandwidth	Bandwidth (may be approximate) associated with the spectral estimate.
method	The method used to calculate the spectrum.

The results are returned invisibly if plot is true.

sarima

*Fit ARIMA Models*

---

### Description

Fits ARIMA models (with diagnostics) in a short command. It can also be used to perform regression with autocorrelated errors.

### Usage

```
sarima(xdata, p, d, q, P = 0, D = 0, Q = 0, S = -1,
      details = TRUE, xreg=NULL, Model=TRUE,
      fixed=NULL, tol = sqrt(.Machine$double.eps),
      no.constant = FALSE, ...)
```

**Arguments**

<code>xdata</code>	univariate time series
<code>p</code>	AR order (must be specified)
<code>d</code>	difference order (must be specified)
<code>q</code>	MA order (must be specified)
<code>P</code>	SAR order; use only for seasonal models
<code>D</code>	seasonal difference; use only for seasonal models
<code>Q</code>	SMA order; use only for seasonal models
<code>S</code>	seasonal period; use only for seasonal models
<code>xreg</code>	Optionally, a vector or matrix of external regressors, which must have the same number of rows as <code>xdata</code> .
<code>Model</code>	if TRUE (default), the model orders are printed on the diagnostic plot.
<code>fixed</code>	optional numeric vector of the same length as the total number of parameters. If supplied, only parameters corresponding to NA entries will be estimated.
<code>details</code>	if FALSE, turns off the diagnostic plot and the output from the nonlinear optimization routine, which is <code>optim</code> . The default is TRUE.
<code>tol</code>	controls the relative tolerance ( <code>reltol</code> in <code>optim</code> ) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default.
<code>no.constant</code>	controls whether or not <code>sarima</code> includes a constant in the model. In particular, if there is no differencing ( $d = 0$ and $D = 0$ ) you get the mean estimate. If there is differencing of order one (either $d = 1$ or $D = 1$ , but not both), a constant term is included in the model. These two conditions may be overridden (i.e., no constant will be included in the model) by setting this to TRUE; e.g., <code>sarima(x, 1, 1, 0, no.constant=TRUE)</code> . Otherwise, no constant or mean term is included in the model. If regressors are included (via <code>xreg</code> ), this is ignored.
<code>...</code>	additional graphical arguments

**Details**

If your time series is in `x` and you want to fit an ARIMA( $p,d,q$ ) model to the data, the basic call is `sarima(x,p,d,q)`. The values  $p,d,q$ , must be specified as there is no default. The results are the parameter estimates, standard errors, AIC, AICc, BIC (as defined in Chapter 2) and diagnostics. To fit a seasonal ARIMA model, the basic call is `sarima(x,p,d,q,P,D,Q,S)`. For example, `sarima(x,2,1,0)` will fit an ARIMA(2,1,0) model to the series in `x`, and `sarima(x,2,1,0,0,1,1,12)` will fit a seasonal ARIMA(2,1,0) \* (0,1,1)<sub>12</sub> model to the series in `x`. The difference between the information criteria given by `sarima()` and `arma()` is that they differ by a scaling factor of the effective sample size.

**Value**

<code>fit</code>	the <code>arma</code> object
<code>degrees_of_freedom</code>	Error degrees of freedom
<code>ttable</code>	a little t-table with two-sided p-values
<code>AIC</code>	value of the AIC - all ICs are the values reported in <code>fit</code> divided by the essential number of observations (after differencing)
<code>AICc</code>	value of the AICc
<code>BIC</code>	value of the BIC

(dog <- sarima(log(AirPassengers),0,1,1,0,1,1,12))
summary(dog$fit) # fit has all the returned arima() values

plot(resid(dog$fit)) # plot the innovations (residuals)
sarima(log(AirPassengers),0,1,1,0,1,1,12,details=FALSE)$BIC # print model BIC only

# fixed parameters
x = sarima.sim( ar=c(0,-.9), n=200 ) + 50
sarima(x, 2,0,0, fixed=c(0,NA,NA))

# fun with diagnostics
sarima(log(AirPassengers),0,1,1,0,1,1,12, gg=TRUE, col=4)
```

---

sarima.for

*ARIMA Forecasting*

---

## Description

ARIMA forecasting.

## Usage

```
sarima.for(xdata,n.ahead,p,d,q,P=0,D=0,Q=0,S=-1,tol=sqrt(.Machine$double.eps),
           no.constant=FALSE, plot=TRUE, plot.all=FALSE,
           xreg = NULL, newxreg = NULL, fixed=NULL, ...)
```

## Arguments

xdata	univariate time series
n.ahead	forecast horizon (number of periods)
p	AR order
d	difference order
q	MA order
P	SAR order; use only for seasonal models

D	seasonal difference; use only for seasonal models
Q	SMA order; use only for seasonal models
S	seasonal period; use only for seasonal models
tol	controls the relative tolerance (reltol) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default.
no.constant	controls whether or not a constant is included in the model. If <code>no.constant=TRUE</code> , no constant is included in the model. See <a href="#">sarima</a> for more details.
plot	if TRUE (default) the data (or some of it) and the forecasts and bounds are plotted
plot.all	if TRUE, all the data are plotted in the graphic; otherwise, only the last 100 observations are plotted in the graphic.
xreg	Optionally, a vector or matrix of external regressors, which must have the same number of rows as the series. If this is used, <code>newxreg</code> MUST be specified.
newxreg	New values of <code>xreg</code> to be used for prediction. Must have at least <code>n.ahead</code> rows.
fixed	optional numeric vector of the same length as the total number of parameters. If supplied, only parameters corresponding to NA entries will be estimated.
...	additional graphical arguments

### Details

For example, `sarima.for(x,5,1,0,1)` will forecast five time points ahead for an ARMA(1,1) fit to `x`. The output prints the forecasts and the standard errors of the forecasts, and supplies a graphic of the forecast with +/- 1 and 2 prediction error bounds.

### Value

<code>pred</code>	the forecasts
<code>se</code>	the prediction (standard) errors

### See Also

[sarima](#)

### Examples

```
sarima.for(log(AirPassengers),12,0,1,1,0,1,1,12)

# fun with the graphic
sarima.for(log(AirPassengers),12,0,1,1,0,1,1,12, gg=TRUE, col=4, main='arf')

# with regressors:
```

```

nummy = length(soi)
n.ahead = 24
nureg = time(soi)[nummy] + seq(1,n.ahead)/12
sarima.for(soi,n.ahead,2,0,0,2,0,0,12, xreg=time(soi), newxreg=nureg)

```

sarima.sim

*ARIMA Simulation*

## Description

Simulate data from (seasonal) ARIMA models.

## Usage

```

sarima.sim(ar = NULL, d = 0, ma = NULL, sar = NULL, D = 0, sma = NULL, S = NULL,
           n = 500, rand.gen = rnorm, innov = NULL, burnin = NA, t0 = 0, ...)

```

## Arguments

ar	coefficients of AR component (does not have to be specified)
d	order of regular difference (does not have to be specified)
ma	coefficients of MA component (does not have to be specified)
sar	coefficients of SAR component (does not have to be specified)
D	order of seasonal difference (does not have to be specified)
sma	coefficients of SMA component (does not have to be specified)
S	seasonal period (does not have to be specified)
n	desired sample size (defaults to 500)
rand.gen	optional; a function to generate the innovations (defaults to normal)
innov	an optional times series of innovations. If not provided, rand.gen is used.
burnin	length of burn-in (a non-negative integer). If NA (the default) a reasonable value is selected.
t0	start time (defaults to 0)
...	additional arguments applied to the innovations. For rand.gen, the standard deviation of the innovations generated by rnorm can be specified by sd or the mean by mean (see details and examples). In addition, rand.gen may be overridden using a preset sequence of innovations specifying innov (see details and examples).

## Details

Will generate a time series of length n from the specified SARIMA model using simplified input.

The use of the term mean in ... refers to the generation of normal innovations. For example, `sarima.sim(ar=.9,mean=5)` will generate data using  $N(5,1)$  or  $5+N(0,1)$  innovations, so that the constant in the model is 5 and the mean of the AR model is  $5/(1-.9) = 50$ . In `sarima.sim(ma=.9,mean=5)`, however, the model mean is 5 (the constant). Also, a random walk with drift = .1 can be generated by `sarima.sim(d=1,mean=.1,burnin=0)`, which is equivalent to `cumsum(rnorm(500,mean=.1))`.

The same story goes if `sd` is specified; i.e., it's applied to the innovations. Because anything specified in `...` refers to the innovations, a simpler way to generate a non-zero mean is to add the value outside the call; see the examples.

If `innov` is used to input the innovations and override `rand.gen`, be sure that `length(innov)` is at least `n + burnin`. If the criterion is not met, the script will return less than the desired number of values and a warning will be given.

### Value

A time series of length `n` from the specified SARIMA model with the specified frequency if the model is seasonal and start time `t0`.

### Note

The model autoregressive polynomial ('AR side' = AR x SAR) is checked for causality and the model moving average polynomial ('MA side' = MA x SMA) is checked invertibility. The script stops and reports an error at the first violation of causality or invertibility; i.e., it will not report multiple errors.

### Examples

```
## AR(2) with mean 50 [n = 500 is default]
y = sarima.sim(ar=c(1.5,-.75)) + 50
tsplot(y)

## ARIMA(0,1,1) with drift
tsplot(sarima.sim(ma=-.8, d=1, mean=.1))

## SAR(1) example from text
Months = c("J","F","M","A","M","J","J","A","S","O","N","D")
sAR = sarima.sim(sar=.9, S=12, n=36)
tsplot(sAR, type='c')
points(sAR, pch=Months, cex=1.1, font=4, col=1:4)

## SARIMA(0,1,1)x(0,1,1)_12 - B&J's favorite
tsplot(sarima.sim(d=1, ma=-.4, D=1, sma=-.6, S=12, n=120))

## infinite variance t-errors
tsplot(sarima.sim(ar=.9, rand.gen=function(n, ...) rt(n, df=2) ))

## use your own innovations
```

```
dog = rexp(150, rate=.5)*sign(runif(150,-1,1))
tsplot(sarima.sim(n=100, ar=.99, innov=dog, burnin=50))

## generate seasonal data but no P, D or Q - you will receive
## a message to make sure that you wanted to do this on purpose:
tsplot(sarima.sim(ar=c(1.5,-.75), n=144, S=12), ylab='doggy', xaxt='n')
mtext(seq(0,144,12), side=1, line=.5, at=0:12)
```

---

scatter.hist

*Scatterplot with Marginal Histograms*

---

## Description

Draws a scatterplot with histograms in the margins.

## Usage

```
scatter.hist(x, y, xlab = NULL, ylab = NULL, title = NULL, pt.size = 1,
             hist.col = gray(0.82), pt.col = gray(0.1, 0.25), pch = 19,
             reset.par = TRUE, ...)
```

## Arguments

x	vector of x-values
y	corresponding vector of y-values
xlab	x-axis label (defaults to name of x)
ylab	y-axis label (defaults to name of y)
title	plot title (optional)
pt.size	size of points in scatterplot
hist.col	color for histograms
pt.col	color of points in scatterplot
pch	scatterplot point character
reset.par	reset graphics - default is TRUE; set to FALSE to add on to scatterplot
...	other graphical parameters

lines(lowess(temp, cmort), col=6)
```

SigExtract

*Signal Extraction And Optimal Filtering***Description**

Performs signal extraction and optimal filtering as discussed in Chapter 4.

**Usage**

```
SigExtract(series, L = c(3, 3), M = 50, max.freq = 0.05)
```

**Arguments**

series	univariate time series to be filtered
L	degree of smoothing (may be a vector); see spans in spec.pgram for more details
M	number of terms used in the lagged regression approximation
max.freq	truncation frequency, which must be larger than 1/M.

**Details**

The basic function of the script, and the default setting, is to remove frequencies above 1/20 (and, in particular, the seasonal frequency of 1 cycle every 12 time points). The sampling frequency of the time series is set to unity prior to the analysis.

**Value**

Returns plots of (1) the original and filtered series, (2) the estimated spectra of each series, (3) the filter coefficients and the desired and attained frequency response function. The filtered series is returned invisibly.

**Note**

The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

sleep1

*Sleep State and Movement Data - Group 1***Description**

Sleep-state and number of movements of infants taken from a study on the effects of prenatal exposure to alcohol. This is Group 1 where the mothers did not drink alcohol during pregnancy.

**Format**

The format is: List of 12 (by subjects)  
 \$ : 'data.frame': 120 obs. of 3 variables:  
 ..\$ min : int [1:120] minute (1 to 120)  
 ..\$ state: int [1:120] sleep state 1 to 6 with NA missing (see details)  
 ..\$ mvmnt: int [1:120] number of movements

**Details**

Per minute sleep state, for approximately 120 minutes, is categorized into one of six possible states, non-REM: NR1 [1] to NR4 [4], and REM [5], or AWAKE [6]. NA means no state is recorded for that minute (if there, it occurs at end of the session). Group 1 (this group) is from mothers who abstained from drinking during pregnancy. In addition, the number of movements per minute are listed.

---

## Description

Fits an AR model to data and computes (and by default plots) the spectral density of the fitted model based on AIC (default) or BIC.

## Usage

```
spec.ic(data, BIC = FALSE, order.max = 30, main = NULL, plot = TRUE,
        detrend = FALSE, method=NULL, ...)
```

**Arguments**

data	a univariate time series.
BIC	if TRUE, fit is based on BIC. If FALSE (default), fit is based on AIC.
order.max	maximum order of models to fit. Defaults to 30.
main	title. Defaults to name of series, method and chosen order.
plot	if TRUE (default) produces a graphic of the estimated AR spectrum.
detrend	if TRUE, detrends the data first. Default is FALSE.
method	method of estimation - a character string specifying the method to fit the model chosen from the following: "yule-walker", "burg", "ols", "mle", "yw". Defaults to "yule-walker".
...	additional arguments.

**Details**

Uses ar to fit the best AR model based on pseudo AIC or BIC. No likelihood is calculated unless method='mle' is used, however, the calculations will be slow. The minimum centered AIC and BIC values and the spectral and frequency ordinates are returned silently.

**Value**

[[1]]	Matrix with columns: ORDER, AIC, BIC
[[2]]	Matrix with columns: freq, spec

## End(Not run)
```

specenv

*Spectral Envelope*

## Description

Computes the spectral envelope of categorical-valued or real-valued time series.

## Usage

```
specenv(xdata, section = NULL, spans = NULL, kernel = NULL, taper = 0,
        significance = 1e-04, plot = TRUE, ylim = NULL, real = FALSE, ...)
```

## Arguments

xdata	For categorical-valued sequences, a matrix with rows that are indicators of the categories represented by the columns, possibly a sequence converted using <a href="#">dna2vector</a> . For real-valued sequences, a matrix with at least two columns that are various transformations of the data.
section	of the form start:end where start < end are positive integers; specifies the section used in the analysis - default is the entire sequence.
spans	specify smoothing used in mvspec.
kernel	specify kernel to be used in mvspec.
taper	specify amount of tapering to be used in mvspec.
significance	significance threshold exhibited in plot - default is .0001; set to NA to cancel
plot	if TRUE (default) a graphic of the spectral envelope is produced
ylim	limits of the spectral envelope axis; if NULL (default), a suitable range is calculated.
real	FALSE (default) for categorical-valued sequences and TRUE for real-valued sequences.
...	other graphical parameters.

## Details

Calculates the spectral envelope for categorical-valued series as discussed in [https://www.stat.pitt.edu/stoffer/dss\\_files/spenv.pdf](https://www.stat.pitt.edu/stoffer/dss_files/spenv.pdf) and summarized in

<https://doi.org/10.1214/ss/1009212816>.

Alternately, calculates the spectral envelope for real-valued series as discussed in [https://doi.org/10.1016/S0378-3758\(96\)00044-4](https://doi.org/10.1016/S0378-3758(96)00044-4).

These concepts are also presented (with examples) in Section 7.9 (Chapter 7) of Time Series Analysis and Its Applications: With R Examples: <https://www.stat.pitt.edu/stoffer/tsa4/>.

For categorical-valued series, the input xdata must be a matrix of indicators which is perhaps a sequence preprocessed using [dna2vector](#).

For real-valued series, the input `xdata` should be a matrix whose columns are various transformations of the univariate series.

The script does not detrend the data prior to estimating spectra. If this is an issue, then detrend the data prior to using this script.

## Value

By default, will produce a graph of the spectral envelope and an approximate significance threshold. A matrix containing: frequency, spectral envelope ordinates, and (1) the scalings of the categories in the order of the categories in the alphabet or (2) the coefficients of the transformations, is returned invisibly.

head(u) # scalings are for A, C, G, and last one T=0 always

# a real-valued series (nyse returns)
x = astsa::nyse
xdata = cbind(x, abs(x), x^2)
u = specenv(xdata, real=TRUE, spans=c(3,3))
# plot optimal transform at freq = .001
beta = u[2, 3:5]
b = beta/beta[2] # makes abs(x) coef=1
gopt = function(x) { b[1]*x+b[2]*abs(x)+b[3]*x^2 }
curve(gopt, -.2, .2, col=4, lwd=2, panel.first=Grid())
g2 = function(x) { b[2]*abs(x) } # corresponding to |x|
curve(g2, -.2,.2, add=TRUE, col=6)

## End(Not run)
```

speech

*Speech Recording***Description**

A small .1 second (1000 points) sample of recorded speech for the phrase "aaa...hhh".

**Format**

The format is: Time-Series [1:1020] from 1 to 1020: 1814 1556 1442 1416 1352 ...

**References**

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

The most recent version of the package can be found at <https://github.com/nickpoison/astsa/>.

In addition, the News and ChangeLog files are at <https://github.com/nickpoison/astsa/blob/master/NEWS.md>.

The webpages for the texts are <https://www.stat.pitt.edu/stoffer/tsa4/> and <https://www.stat.pitt.edu/stoffer/tsda/>.

ssm

*State Space Model***Description**

Fits a simple univariate state space model,  $x[t] = \alpha + \phi x[t-1] + w[t]$ , and  $y[t] = A x[t] + v[t]$ . The parameters  $\alpha$ ,  $\phi$ ,  $\sigma_w$  and  $\sigma_v$  are estimated; parameter  $\phi$  may be fixed. State predictions and smoothers and corresponding error variances are evaluated at the estimates. The sample size must be at least 20.

**Usage**

```
ssm(y, A, phi, alpha, sigw, sigv, fixphi = FALSE)
```

**Arguments**

y	data
A	measurement value (fixed constant)
phi	initial value of phi, may be fixed
alpha	initial value for alpha
sigw	initial value for $\sigma_w$
sigv	initial value for $\sigma_v$
fixphi	if TRUE, the phi parameter is fixed

## Details

The script works for a specific univariate state space model. The initial state conditions use a default calculation and cannot be specified. The parameter estimates are printed and the script returns the state predictors and smoothers.

## Value

At the MLEs, these are returned invisibly:

Xp	time series - state prediction, $x_t^{t-1}$
Pp	corresponding MSPEs, $P_t^{t-1}$
Xf	time series - state filter, $x_t^t$
Pf	corresponding MSEs, $P_t^t$
Xs	time series - state smoother, $x_t^n$
Ps	corresponding MSEs, $P_t^n$

---

star

*Variable Star*

---

## Description

The magnitude of a star taken at midnight for 600 consecutive days. The data are taken from the classic text, The Calculus of Observations, a Treatise on Numerical Mathematics, by E.T. Whittaker and G. Robinson, (1923, Blackie and Son, Ltd.).

## Format

The format is: Time-Series [1:600] from 1 to 600: 25 28 31 32 33 33 32 ...

## References

You can find demonstrations of astsa capabilities at [FUN WITH ASTSA](#).

stoch.reg

*Frequency Domain Stochastic Regression***Description**

Performs frequency domain stochastic regression discussed in Chapter 7.

**Usage**

```
stoch.reg(data, cols.full, cols.red, alpha, L, M, plot.which)
```

**Arguments**

data	data matrix
cols.full	specify columns of data matrix that are in the full model
cols.red	specify columns of data matrix that are in the reduced model (use NULL if there are no inputs in the reduced model)
alpha	test size
L	smoothing - see spans in spec.pgram
M	number of points in the discretization of the integral
plot.which	coh or F.stat, to plot either the squared-coherencies or the F-statistics, respectively

**Value**

power.full	spectrum under the full model
power.red	spectrum under the reduced model
Betahat	regression parameter estimates
eF	pointwise (by frequency) F-tests
coh	coherency

**Note**

The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

SVfilter

*Switching Filter (for Stochastic Volatility Models)***Description**

Performs a special case switching filter when the observational noise is a certain mixture of normals. Used to fit a stochastic volatility model.

**Usage**

```
SVfilter(num, y, phi0, phi1, sQ, alpha, sR0, mu1, sR1)
```

**Arguments**

num	number of observations
y	time series of returns
phi0	state constant
phi1	state transition parameter
sQ	state standard deviation
alpha	observation constant
sR0	observation error standard deviation for mixture component zero
mu1	observation error mean for mixture component one
sR1	observation error standard deviation for mixture component one

**Value**

xp	one-step-ahead prediction of the volatility
Pp	mean square prediction error of the volatility
like	the negative of the log likelihood at the given parameter values

test.linear	<i>Test Linearity of a Time Series via Normalized Bispectrum</i>
-------------	--

---

**Description**

Produces a plot of the tail probabilities of a normalized bispectrum of a series under the assumption the model is a linear process with iid innovations.

**Usage**

```
test.linear(series, color = TRUE, detrend = FALSE)
```

**Arguments**

series	the time series (univariate only)
color	if FALSE, the graphic is produced in gray scale
detrend	if TRUE, the series is detrended first

**Value**

prob	matrix of tail probabilities - returned invisibly
------	---

**Note**

The null hypothesis is that the data are from a linear process with i.i.d. innovations. Under the null hypothesis, the bispectrum is constant over all frequencies. Chi-squared test statistics are formed in blocks to measure departures from the null hypothesis and the corresponding p-values are displayed in a graphic and returned invisibly. Details are in Hinich, M. and Wolinsky, M. (2005). Normalizing bispectra. *Journal of Statistical Planning and Inference*, 130, 405–411.

trend	<i>Estimate Trend</i>
-------	-----------------------

---

### Description

Estimates the trend (polynomial or lowess) of a time series and returns a graphic of the series with the trend and error bounds superimposed.

### Usage

```
trend(series, order = 1, lowess = FALSE, lowspan = 2/3, col = c(4, 6), ylab = NULL, ...)
```

### Arguments

series	The time series to be analyzed (univariate only).
order	Order of the polynomial used to estimate the trend with a linear default (order=1) unless lowess is TRUE.
lowess	If TRUE, lowess is used to find the trend. The default is FALSE.
lowspan	The smoother span used for lowess.
col	For the graphic, the color of the data (default is 4) and the color of the trend (default is 6).
ylab	Label for the vertical axis (default is the name of the series).
...	Other graphical parameters.

### Details

Produces a graphic of the time series with the trend and a .95 pointwise confidence interval superimposed. The trend estimate and the error bounds are returned invisibly.

### Value

Produces a graphic and returns the trend estimate and error bounds invisibly (see details).

[detrend](#)

**Examples**

```
trend(soi)

trend(soi, lowess=TRUE)
```

tsplot

*Time Series Plot***Description**

Produces a nice plot of univariate or multiple time series in one easy line.

**Usage**

```
tsplot(x, y=NULL, main=NULL, ylab=NULL, xlab='Time', type=NULL,
       margins=.25, ncolm=1, byrow=TRUE, minor=TRUE, nxm=2, nym=1,
       xm.grid=TRUE, ym.grid =TRUE, col=1, gg=FALSE, spaghetti=FALSE,
       pch=NULL, lty=1, lwd=1, ...)
```

**Arguments**

x, y	time series to be plotted; if both present, x will be the time index.
main	add a plot title - the default is no title.
ylab	y-axis label - the default is the name of the ts object.
xlab	x-axis label - the default is 'Time'.
type	type of plot - the default is line.
margins	inches to add (or subtract) to the margins.
ncolm	for multiple time series, the number of columns to plot.
byrow	for multiple time series - if TRUE (default), plot series row wise; if FALSE, plot series column wise.
minor, nxm, nym	if minor=TRUE, the number of minor tick marks on x-axis, y-axis. minor=FALSE removes both or set either to 0 or 1 to remove. The default is one minor tick on the x-axis and none on the y-axis.
xm.grid, ym.grid	if TRUE (default), adds grid lines at minor x-axis, y-axis ticks.
col	line color(s), can be a vector for multiple time series.
gg	if TRUE, will produce a gris-gris plot (gray graphic interior with white grid lines); the default is FALSE. The grammar of astsa is voodoo; see <a href="https://musicaficionado.blog/2017/11/08/gris-gris-by-dr-john/">https://musicaficionado.blog/2017/11/08/gris-gris-by-dr-john/</a>
spaghetti	if TRUE, will produce a spaghetti plot (all series on same plot).
pch	plot symbols (default is 1, circle); can be a vector for multiple plots.
lty	line type (default is 1, solid line); can be a vector for multiple plots.
lwd	line width (default is 1); can be a vector for multiple plots.
...	other graphical parameteres; see <a href="#">par</a> .
